Funding for the UNCTAD-ICTSD Project on Intellectual Property Rights and Sustainable Development has been received from the Department of International Development (DFID, UK), the Swedish International Development Agency (SIDA, Sweden) and the Rockefeller Foundation.

The Project is being implemented by the International Centre for Trade and Sustainable Development (ICTSD) and the secretariat of the United Nations Conference on Trade and Development (UNCTAD) (Project Number INT/OT/1BH). The broad aim is to improve the understanding of intellectual property rights-related issues among developing countries and to assist them in building their capacity for ongoing as well as future negotiations on intellectual property rights (IPRs).

For details on the activities of the Project and all available material, see <http://www.iprsonline.org/unctadictsd/description.htm>

FOREWORD

The present paper dealing with Development in the Information Age: Issues in the Regulation of Intellectual Property Rights, Computer Software and Electronic Commerce is one contribution of the Project to the ongoing debate on the impact and relevance of intellectual property to development. In essence, it highlights the particular importance for developing countries of information communication technologies (ICT) as a tool for economic growth.

ICT pose challenges to developing countries, but at the same time offer opportunities. The main challenges arise from international rules on copyright and database protection, which are increasingly restricting free access to protected works that developing countries need in the context of public policies such as education and research. On top of low Internet use and penetration prevailing in most developing countries, these legal tools may represent additional access barriers. In order to mitigate such effects, developing countries should seek to balance effective protection of intellectual property rights (IPRs) against robust limitations of exclusive rights to encourage competition and socially beneficial uses of ICT. In this respect, the international IPRs system provides important flexibilities in the implementation of IPRs obligations. Making use of these flexibilities is a way for developing countries to reap the benefits offered to them by ICT, in particular with respect to the promotion of the local music industry and on-line based education and research. To which extent ICT may actually be used as an effective tool for economic growth largely depends on the domestic regulatory framework, taking account of the particular situation in each country.

Intellectual property rights have never been more economically and politically important or controversial than they are today. Patents, copyrights, trademarks, industrial designs, integrated circuits and geographical indications are frequently mentioned in discussions and debates on such diverse topics as public health, food security, education, trade, industrial policy, traditional knowledge, biodiversity, biotechnology, the Internet, the entertainment and media industries. In a knowledge-based economy, there is no doubt that an understanding of IPRs is indispensable to informed policy making in all areas of human development.

Intellectual property was until recently the domain of specialists and producers of intellectual property rights. The TRIPS Agreement concluded during the Uruguay Round negotiations has signalled a major shift in this regard. The incorporation of intellectual property rights into the multilateral trading system and its relationship with a wide area of key public policy issues has elicited great concern over its pervasive role in people's lives and in society in general. Developing country members of the World Trade Organization (WTO) no longer have the policy options and flexibilities developed countries had in using IPRs to support their national development. But, TRIPS is not the end of the story. Significant new developments are taking place at the international, regional and bilateral level that build on and strengthen the minimum TRIPS standards through the progressive harmonisation of policies along standards of technologically advanced countries. The challenges ahead in designing and implementing IP-policy at the national and international levels are considerable.

Empirical evidence on the role of IP protection in promoting innovation and growth in general remains limited and inconclusive. Conflicting views also persist on the impacts of IPRs in the development prospects. Some point out that, in a modern economy, the minimum standards laid down in TRIPS will bring benefits to developing countries by creating the incentive structure necessary for knowledge generation and diffusion, technology transfer and private investment flows. Others stress that intellectual property, especially some of its elements, such as the patenting regime, will adversely affect the pursuit of sustainable development strategies by raising the prices of essential drugs to levels that are too high for the poor to afford; limiting the availability of educational materials for developing country school and university students; legitimising the piracy of traditional knowledge; and undermining the self-reliance of resource-poor farmers.

It is urgent, therefore, to ask the question: How can developing countries use IP tools to advance their development strategy? What are the key concerns surrounding the issues of IPRs for developing countries? What are the specific difficulties they face in intellectual property negotiations? Is intellectual property directly relevant to sustainable development and to the achievement of agreed international development goals? Do they have the capacity, especially the least developed among them, to formulate their negotiating positions and become well-informed negotiating partners? These are essential questions that policy makers need to address in order to design IPR laws and policies that best meet the needs of their people and negotiate effectively in future agreements.

It is to address some of these questions that the joint UNCTAD-ICTSD Project on Intellectual Property and Sustainable Development was launched in July 2001. One central objective has been to facilitate the emergence of a critical mass of well-informed stakeholders in developing countries - including decision makers, negotiators but also the private sector and civil society - who will be able to define their own sustainable human development objectives in the field of IPRs and effectively advance them at the national and international levels.

UNCTAD Secretary General

EXECUTIVE SUMMARY

The commercialisation of information communication technologies has been widely recognised as an important tool for economic growth. Not surprisingly, the associated benefits of information technology have been under-realised in most developing countries and LDCs. The persistent “digital divide” reflects disproportionate access to the most fundamental tools of this new economy, which includes digital content. Two copyright treaties, negotiated shortly after the WTO Agreement on Trade-related Aspects of Intellectual Property Rights (TRIPS), establish minimum terms of a global framework for access and use of creative work in the digital environment.

The Internet Treaties

The World Intellectual Property Organisation (WIPO) Copyright Treaty and the WIPO Performances and Phonograms Treaty, together commonly referred to as the WIPO “Internet Treaties”, entered into force in 2002. The first of these extends copyright protection to authors of literary and artistic works;¹ computer programmes and;² to compilations of data.³ It specifically provides for a right of distribution, right of rental and right of communication to the public,⁴ as well as other Berne Convention rights incorporated by reference.

In addition to these traditional copyright rights, the WIPO Copyright Treaty (WCT) introduced ancillary principles to the international copyright system. Article 11 obligates members to provide protection against the circumvention of “effective technological measures” used by authors in connection with the exercise of their rights under the Berne Convention or the WCT. This provision requires members to sanction efforts to circumvent technological protections used by owners to control access or use of protected works. For example, encryption of protected digital content or password protections of such content each constitutes “effective technological measures”. Providing a user with directions to decrypt the content, or software that allows a user to bypass the password screen are examples of acts of circumvention prohibited under Article 11.

Article 12 further requires remedies against persons who tamper with rights management information (RMI) knowing or having reason to know that such tampering will induce, enable or facilitate copyright infringement. RMI is defined by the Treaty as information which identifies the work, including the author, the owner of a particular right in the work, or information concerning terms of use of the work.⁵ Such information is generally intended to facilitate identification of owners and payment/permission to use the work. In the digital environment RMI is an important tool for owners to monitor, control and enforce copyright interests. From an author’s perspective, RMI is particularly beneficial in countries where domestic laws permit use under a compulsory license regime, or recognise certain defences for users, when owners are difficult to locate.

The WIPO Performances and Phonograms Treaty (WPPT) deals with performers and producers of phonograms. Performers⁶ are accorded moral rights for live aural performances or performances fixed in phonograms; the right to authorise broadcasting and public communication of unfixed performances and to fix their unfixed performances; the right to authorise reproduction of their fixed performances; the right to authorise distribution to the public of their fixed performances; the right to authorise the commercial rental to the public of original and copies of their performances; the right to authorise making available to the public their performances fixed in phonograms by wire or wireless means. Producers⁷ of phonograms enjoy the exclusive right of authorising reproductions of their phonograms; the right of authorising distribution to the public of their phonograms; the right of commercial rental to the public of their phonograms; and the exclusive right to make phonograms available to the public by wire or wireless means. Both performers and producers of phonograms enjoy a right to remuneration for commercial broadcasting or any communication to the public.⁸ The WPPT contains the same member obligations as the WCT with respect to circumvention of technological measures and protection of RMI.⁹

The Internet Treaties and Development Policy

The WIPO Internet treaties essentially extend and upgrade the Berne Convention for the information age. The “para-copyright” provisions - the anti-circumvention and RMI clauses - have proven the most controversial, particularly as they apply to the opportunities for public access to digital works. Specifically, under the implementation model of the Digital Millennium Copyright Act (DMCA)¹⁰ adopted by the United States, traditional access mechanisms such as fair use or fair dealing exceptions have been constrained. Rather than facilitate prospects for diffusion and access to works, the copyright regime has been co-opted to consolidate social gains associated with new technologies and to transform these gains into economic opportunities for owners.

The important balance between access to copyrighted works and protection for authors is vital for developing countries and LDCs. Despite provisions for limitations and exceptions to the rights granted to authors/ owners of protected works, the WIPO treaties represent minimum standards from which countries can deviate only by providing greater rights than required as the United States has done under the DMCA. The maximalist approach to interpreting the available scope of permissible limitations and exceptions is reinforced by the similarities between TRIPS Article 13, and Articles 10 and 16 of the WCT and WPPT. The similarities suggest that it is not improbable that interpretations of the Internet treaties can be influenced by the ideology of the TRIPS Agreement. Consequently, public welfare interests will require explicit limitations and exceptions that at a minimum facilitate access and use of digital works for study, research, and educational purposes.

It is ironic, however, that the majority of countries that have ratified the Internet treaties are developing countries. Political pressure through bilateral trade agreements and other foreign relations priorities may account for this anomaly. Ironically, however, most of these countries have extremely low Internet access or penetration rates; thus widespread infringement of digital content is not a viable prospect in the immediate future.

Consequently, membership of the Treaties in the absence of the technological infrastructure to access and use - much less infringe - digital works simply transforms these countries into subsidisers of the global copyright system. These countries are providing protection for works to which they have little or no opportunity of access, at least in the short term. Low Internet use and penetration already supplies a layer of access barriers for the public in developing countries; adding extra copyright obligations to existing technological challenges unjustifiably and preemptively raises the cost of access to copyrighted works. In the regional context, this expansive protection for digital works also has implications for how protected works may circulate between high income developing countries where access may be more probable, and low-income developing countries where access rates are negligible. Given the unprecedented availability of literary and artistic works on the Internet, it is highly prejudicial for developing countries and LDCs to adopt copyright laws that make access to this vast resource space more difficult or costly.

Development Opportunities and the Information Age

Strategies to utilise information technology for development priorities and prospects vary from sector to sector, and from country to country. However, the possibility of exploiting the comparative advantage of many developing countries in the creation, production and distribution of popular music has attracted significant attention. There are several important benefits information technology offers for domestic music industries, particularly with respect to penetrating the global music industry. Developing countries can adopt a staged approach, corresponding to levels of available technology, to enhance the music supply chain and to generate new markets for distribution of domestic music.

A variety of price and distribution models are available to facilitate producer to consumer sales between artists in developing countries and the global audience. Existing practices utilised by Internet auction and trading sites can be explored to determine methods of payment for digital transactions. In addition to sales and distribution, information technology also enables advertising and promotion through digital communities. In sum, the disintermediation occasioned by the Internet in the context of goods and services, also offers important opportunities for producers of cultural products to penetrate the global market.

Another important area positively affected by information technology is public education in developing countries and LDCs. Many developing countries have identified education as a

development priority for the information age, and many of these countries assume that the Internet will play an important role in accomplishing this goal. Institutional alliances between developed and developing countries using distance education offers a real prospect of educating a vast number of the world's poor. Copyright legislation in many developing countries may need to be modified to legitimate policies that seek to use the Internet to access educational materials available in digital format. Traditional copyright rights that include the right to reproduce, distribute or communicate works to the public must be balanced by limitations that would make educational uses permissible. Developing countries must consider these issues in multilateral or bilateral negotiations that urge expansive copyright protection at the expense of important development goals. Specifically, developing countries must carefully evaluate negotiations for a webcasting treaty for its effect on educational uses of protected works, particularly as webcasts supplement (and eventually may replace) traditional broadcasting media.

It should be noted that the possibility of using computer networks to promote cultural industries requires copyright protection of such cultural goods, particularly music. The point of urging cautious deliberation is not that copyright is unnecessary or ill-advised as a development tool. Consider, for example, the Open Source model for software development; it is *precisely* the proprietary right that facilitates the imposition of conditions which require contributors to license their contributions on open terms. The argument is that development interests require an effective system of protection, balanced by robust limitations to encourage competition and socially beneficial uses. Copyright protection should not be offered as an instrument of private monopoly at the expense of public welfare.

Some Policy Considerations

It is vitally important that developing countries and LDCs appreciate the pervasiveness of copyright in defining the structure, terms and conditions of access to the basic tools of the information age and, consequently, the prospects for effective and successful use of information technologies to advance development goals. When considered in conjunction with other emerging proprietary models such as business method patents or database protection, copyright law is clearly a central mechanism for extending additional costs and uncertain benefits of foreign creative endeavour in developing regions. In summary, a few factors should be considered for development oriented policies:

- Exploiting the potential of the Internet to facilitate development objectives requires access to hardware (computers), software and content. Intellectual property agreements have important implications for access to software. Developing countries need to explore alternatives to proprietary regimes, the most important being the Open Source model which has proven to be a dynamic and, in some instances, more effective model of software development. For developing countries and LDCs, the Open Source

model is also valuable for the opportunities it offers to facilitate training of domestic software engineers, and the relatively low cost of complementary technologies.

- International copyright agreements have a significant and unavoidable impact on access to creative works in the digital age. Developing countries must insist on the possibility of enacting domestic limitations, including the application of compulsory licenses, which encourage access and use of digital works. They should eschew interpretations of copyright treaties that extend the negotiated minimum standards, and resist incorporation of these agreements in TRIPS.

Unbalanced Copyright Regimes Diminish Public Interest Values

The information age offers new opportunities to increase productivity in all countries regardless of the level of development. As a strategic matter, the more developing countries and LDCs participate in post-TRIPS copyright regimes, the easier “TRIPS-plus” standards can be advanced as the ineluctable paradigm for copyright protection in the information age. Such a result can limit the potential of the Internet for broad diffusion of information and creative works generally. Importantly, unbalanced copyright regimes diminish the importance of a socially beneficial culture that values public interest as an important welfare function of a proprietary system for creative works. Nonetheless, copyright protection in developing countries and LDCs is important for domestic creative efforts particularly for cultural industries. Such protection should foster, protect, and promote creation and use for the mutual benefit of authors and consumers.

1. INTRODUCTION

There is an established consensus that the information age offers significant potential for growth in all countries. The benefits of communications networks, principally reduced transaction costs and the ability to overcome impediments to productivity, are especially important in considerations of how developing countries might more fully participate in the global economy.

Despite the acknowledged potential of the information age for economic growth, most developing countries have yet to significantly benefit from the vast resources and opportunities made possible by information technology. There remains considerable uncertainty about the specific ways information technology can be applied to development goals and to promote identified objectives. Determining critical elements of a regulatory environment conducive for growth and development is particularly challenging given the sectoral and context-specific nature of the benefits of information technologies for productive economic and social activity. Importantly, the pervasive role of intellectual property rights in regulating almost all aspects of the digital economy has been insufficiently analysed as part of a broad development agenda for the digital economy. Patents, particularly pharmaceutical patents, have long been the subject of concerns about the role of intellectual property in development. This has occasioned neglect of other intellectual property rights such as copyright and trademarks. Yet, copyright law is essential to the viability of the Internet as a development tool. Virtually all aspects of the digital economy are affected by copyright or recent quasi-copyright systems that provide rights for technological protections of digital content. Copyrights, trademarks and patents each, and in some cases jointly, impact prospects for electronic commerce, access to computer software, the possibility of marketing cultural goods, the availability of educational content and much more. In short, intellectual property regulation permeates all aspects of the development opportunities occasioned by the commercialisation of information technology.

This paper analyses the ways in which intellectual property rights affect options and prospects for development, particularly in implementing new business models, exploiting new markets and exploring new avenues of economic growth. It is not an exhaustive legal analysis of all the intellectual property issues that affect developing countries with respect to digital

technologies. The primary objective is to present and analyse the significant role of intellectual property rights in advancing *and* constraining development objectives in the specific context of the advantages offered by information technology. Consequently, the paper emphasizes and highlights areas that are generally treated as distinct problems or opportunities for developing countries, and argues that intellectual property regulation is fundamental to how effectively development goals can be pursued in the information era. Owner's rights established by multilateral treaties do not adequately, if at all, account for public welfare concerns that are important for development goals. On the other hand, owner's rights are important to the capacity of developing countries to leverage cultural goods in the global market place. Devising national policies that manage the tensions inherent in intellectual property rights for the digital age is a challenge for all countries. For developing countries in particular, this challenge has fundamental implications for the attainment of basic economic goals. Controversial issues such as database protection, emerging issues such as the appropriateness of business method patents, alternative proprietary models such as the Open Source movement, and the prospects of copyright as a tool for penetrating global markets in cultural goods are just some of the topics considered by this paper. Each represents an integral part of the legal fabric of the information age with attendant ramifications for development strategies.

Section 2 of the paper is an overview of the technological, legal and economic framework of the information age. It highlights policy considerations for developing countries, with a brief discussion of characteristics of the digital economy and the computer networks that create and support new economic opportunities.

Section 3 discusses the importance of e-commerce as a means of stimulating economic growth. Since e-commerce activity depends largely on access to the Internet, this part of the paper also examines various forms of the digital divide between developed and developing countries and corresponding levels of e-commerce activity. Additionally, it provides a brief history of the Internet and emphasizes the regulatory conditions that facilitated development of the fundamental technologies of the information age.

Section 4 of the paper analyses the regulation of computer software in the United States and the European Union, emphasizing the implications of business method patents for e-commerce. This part also discusses the implementation of international intellectual property agreements, as well as the development of domestic regimes in the United States and the European Union as they relate to business method patents and database protection. It offers some considerations of database protection and business method patents from a development perspective.

Section 5 of the paper examines specific areas where developing countries can actively benefit and exploit comparative advantages. Several case studies on cultural industries offer important evidence about the value of copyright and computer networks for developing countries. The section focuses on the music

sector as an important area for development prospects, and provides an outline of pertinent rights afforded by international copyright agreements. Another important development issue affected by copyright regulation concerns access to educational materials and the possibility of distance education. Copyright law will largely shape how developing countries can take advantage of computer networks for educational purposes and this issue is briefly discussed.

Section 6 outlines emerging considerations such as the Open Source movement, and discusses elements of a framework necessary to facilitate appropriation of the benefits of the information age for developing countries. The paper concludes by highlighting issues that require specific attention by policy makers, as well as repeating a few suggestions for policy considerations.

2. AN OVERVIEW OF THE TECHNOLOGICAL, LEGAL AND ECONOMIC FRAMEWORK OF THE INFORMATION AGE

2.1 Some Policy Considerations

There is no question that the information age, propelled by ongoing innovation in the development and use of information technologies, provides an unprecedented opportunity to transform existing patterns of global production and the corresponding disproportionate diffusion of technical knowledge, wealth and inequality among nations and peoples. The profound opportunities presented by the information revolution have been recognized by international agencies, governmental organizations, nongovernmental organizations and the public as a whole. In March 2003, OECD Directorates, in conjunction with the World Bank and UN Agencies organized a Forum on “Integrating ICT in Development Programmes.”¹¹ This Forum built on an earlier one that focused on using information technology to effect poverty reduction.¹² Both these Forums responded to calls by members of the international community, including developing countries, to integrate information technologies within mainstream development aid programs.¹³

One of profound effects of the Internet is the connectivity that is possible for millions of users worldwide. In terms of supply, the Internet offers access to services, products and information that otherwise would be unavailable without the physical movement of persons. Internet applications offer an unprecedented possibility for access and delivery of important socio-economic inputs such as education, medical information, and, in a more limited fashion, health care and associated services. It also offers opportunities for domestic cultural industries to penetrate global markets. Given the fact that inadequate or ill-functioning infrastructure constitute principal barriers to access and delivery of social goods, the potential of the Internet to overcome these difficulties in developing countries is singularly important. To effectively participate and enjoy the benefits of the information economy, however, developing countries will need to make investments in the “soft” infrastructure of their domestic economies by adopting policies to deal with illiteracy, promote tertiary education, and investments in R&D. The success of development strategies and the attainment of development goals require attention to these foundational requisites for accessing, utilizing, and facilitating productivity in the information economy. The following

points summarize important factors that policy makers should keep in mind in formulating information policies with a development focus.

1. Exploiting the potential of the Internet to facilitate development objectives requires access to hardware (computers), software and content. Competition and deregulation in the telecommunications industry will enhance the opportunities for access to digital content by citizens.
2. Cooperation among various industries and enterprises is an indispensable aspect of successful technology platforms. It is important to encourage the use of computer networks in identified sectors in order to experience net gains and to facilitate integration into the global supply chain. Countries must evaluate areas of comparative advantage and determine how information technology can enhance such advantage while improving competitive advantage in other areas.
3. Institutions of higher learning are an important aspect of developing a strong technology base in any society. This includes training software developers, mathematicians and telecommunications experts. Education should occupy a central place in development strategies for the information age. This will require implementation of copyright treaties in a way that ensures that proprietary rights are balanced with public policy limitations that permit use and access for educational purposes.
4. Economic growth in the information age has a strong correlation with medium to highly skilled labour. With respect to investments in education, the cost of educational materials has been significant. Given the wealth of information available on the Internet, dissemination of educational content over computer networks is an invaluable opportunity for improving access to, and the quality of, education in developing countries.
5. The cumulative effects of expansive proprietary rights must be carefully weighed in order to develop policies that can effectively encourage

domestic creativity while simultaneously facilitating access to existing content online. In this regard, countries must carefully determine the relative costs and benefits of accession to multilateral copyright agreements. More specifically, the method of domestic implementation of these agreements is critically important for fashioning the appropriate domestic environment needed to ensure sustained access to informational works. Developing countries should resist the incorporation of these treaties into the TRIPS Agreement as this may limit the range of policy options available to promote domestic objectives, while also subjecting these countries to the WTO dispute settlement system.

6. Given high population numbers in the developing world, the gradual introduction of information technology may cause initial worker dislocation. Any use of information technology must therefore consider labour implications.¹⁴
7. Social, economic and legal institutions must function well in order to support economic growth in the information age. In leading developing countries such as India, Korea, China, and Brazil, the existence of macroeconomic stability has greatly facilitated the opportunities for economic development utilizing information products and information technology. While other indicators such as use of technology and technology

penetration are important indices of the potential for development progress in the information age, the experience of some developing countries suggest that there are ways to capitalize on existing strengths to build up domestic firms' opportunities to service the information economy. For example, the software sector of the Indian economy is developing its own technology and content for export and domestic use.¹⁵ In other words, this industry is dynamically pursuing opportunities for growth that are not dependent solely on outsourcing. Even the nature of the outsourced products has changed to reflect greater sophistication.¹⁶

8. Despite the emphasis in many studies on the need for a strong telecommunications infrastructure for greater physical access to the Internet,¹⁷ the development of third generation Internet technologies through satellite suggests that eventually, this major barrier may not be as significant for access to the Internet, particular in rural areas. An important task, then, is to develop guidelines as to how much developing country resources should be invested in adapting to the current technological state of art, given the on-going rate of innovation. These are issues that require careful and sustained empirical analysis to ensure that developing countries are not persistently left behind in the information age.

2.2. Characteristics and Challenges of the Digital Economy

In the new global economy, information is simultaneously an intrinsic characteristic of markets as well as a product for sale in markets.¹⁸ Intellectual property subjects such as copyrights, trademarks, and patents, as well as new subjects of proprietary protection such as databases, are all paradigmatic examples of information products. At the same time, the Internet has made information about comparative prices for goods and services readily and easily available through software agents that aggregate data from various Internet sites.¹⁹ Indeed, orthodox price setting and price distribution theories²⁰ require reconsideration given the comparative ease with which product prices can be compared on the Internet. Efficient price comparisons represent one example of how the Internet has affected markets through reduced transaction costs.²¹ Further, in this new economy, markets can straddle both the digital

environment of the Internet and "real time" markets when the relationship between on-line or "electronic" commerce and traditional commerce is simply a continuum with producers converting certain aspects of business transactions (e.g., selection and payment) to the Internet, while retaining labour for other aspects such as customer service. Alternatively, some markets in services may exist solely online such as data management and electronic share trading,²² while other markets capitalize fully on the savings in labour, space and time enabled by information technology.²³ Electronic commerce encompasses all these different markets and uses of technology for economic and commercial purposes.²⁴ At the very least, electronic commerce implies the use of digital information technology to transform existing business models and

practices, and to improve, replace, renew or recreate products and services utilizing computer networks.²⁵

The potential for economic growth that is made possible by information technology has also engendered new challenges over what rules are necessary to govern the information market. For example, there is an unremitting demand for legal rules that will introduce limits on how consumers access and use digital content,²⁶ and how producers collect and use personal data.²⁷ The range and diversity of new products, new services, and new production, distribution and pricing strategies occasioned by the information age engenders regulatory concerns ranging from access to the Internet, the effects of broader and stronger intellectual property rights, to jurisdiction over disputes that arise from interaction on the Internet, the significant costs of “treating” viruses that damage and destroy technology infrastructure, the security of personal information, and many more challenges.

It is clear that the global reach of the Internet requires a multilateral approach to these continuously evolving complex issues.²⁸ However, as developed countries seek to create new rules, or to adapt old rules to the new economy, most developing and least developed countries remain at the periphery of this new era both in terms of access to the technological tools as well as participation in setting the global agenda. In sum, the current geo-political and economic trends of the information economy reflect those that characterized the international division of labour after the industrial revolution in that labour intensive phases of production were relocated to regions with surplus low-cost labour.²⁹ Similarly in the information age, major developing countries have participated in the technological environment primarily by serving as important harbours for outsourcing. While this has resulted in important gains for such countries, particularly India and China, the pertinent question is whether a model based mainly on servicing foreign markets can sustain long-term economic growth.³⁰

For *developed* countries, empirical studies³¹ have explored trends and policies, and suggested guidelines³² to encourage the continued growth of productivity through electronic commerce and associated information communication technologies. The results of these studies confirm the importance of investments in information technology as a key factor of domestic growth.³³ Macroeconomic conditions necessary for sustained growth in this new environment in developed countries are equally applicable to developing countries with the exception of intellectual property regulation. In this regard, the current strategies of some developed countries are in tension with the open regulatory approach that engendered the initial technologies of the information age. Constructing a balanced regime for the competing interests and concerns of owners, users and creators nationally is difficult and costly; doing so globally is a daunting challenge. At the minimum, it will require a reconsideration of some core assumptions and inherent tensions in existing global regulatory frameworks ranging from free trade, antitrust, international communications standards as well as intellectual property rights.

Despite increasing domestic and global concern about the effects of expansive intellectual property rights on the competition and innovation environments,³⁴ efforts by owners to strengthen intellectual property rights have continued unabated. Emerging impediments to development goals in the specific context of new information technologies are evident in various regional and multilateral negotiations over intellectual property rights that require developing countries to adopt strong rights with minimum attention to countervailing access mechanisms for consumers. Efforts from academic and policy quarters of some developed countries emphasizing the importance of encouraging the broadest possible exploitation of information goods are an important factor in this regard.³⁵ Developing countries have much to gain by harnessing this public concern in the context of multilateral and bilateral negotiations over intellectual property rights.

3. DEVELOPMENT IN THE INFORMATION AGE: E-COMMERCE AND THE ACCESS TO THE INTERNET

3.1 Development Prospects and the Challenge of Access in the Information Economy

There has been a significant amount of academic and public commentary about disproportionate levels of access to the Internet between developed and developing countries and the implications of this “digital divide” for economic development. Undoubtedly, access to the foundational infrastructure of the information age is indispensable for exploiting the prospects of new technologies for development.³⁶ Thus far, analyses of the digital divide reflect an evolutionary trend. In initial evaluations by scholars and policy makers, the challenge of “access” focused primarily on the relative lack of access to computers.³⁷ This aspect of the digital divide was also noted as a significant problem in developed countries as evidenced by disproportionate access rates in urban and rural areas, and along social, ethnic and gender distinctions.³⁸ However, as Moore’s law³⁹ has taken effect, access to computers and related complementary goods has significantly improved in the developed world.⁴⁰ Commentators suggest that developing countries will also benefit from decreasing prices of computer technology.⁴¹ The available evidence suggests that there is already some improvement at the margins in higher-income developing countries.⁴² It seems clear, however, that continued growth in access to computers will require innovative organizational models⁴³ in addition to strategies to increase overall income so that the vast majority of citizens are empowered to purchase the necessary hardware and software.

Next, concerns about the digital divide directed focus to the telecommunications substructure of the Internet and the need to enhance competition in this industry. In most countries, the complex relationship between telephone service providers, cable service providers and the rise of Internet Service Providers (ISPs) has given rise to a variety of pricing models to sustain differences in the market structure.⁴⁴ Pricing strategies permeate and fundamentally affect the problem of access.⁴⁵ To the extent that cost remains an integral part of the access conundrum, competition in the market for services that are related to Internet use is important. Consider, for example, that in 2001, the top ten ISPs in the United States accounted for over 66% of the total market share; the top four companies accounted for

just over half the market.⁴⁶ National ISPs generate roughly 44% of total revenues in the industry.⁴⁷ As technologies interface and combine features of old services and new functions (such as voiceover Internet protocol), distinctly regulated services converge thus creating opportunities for monopolistic organizations to emerge.⁴⁸ The pricing implications of inadequate competition in the adjacent technologies to Internet functionality constitute another important aspect of access limitations to the information economy.⁴⁹

A third level of the digital divide involves increasingly high barriers to content available on the Internet. Expansive intellectual property laws increasingly enclose⁵⁰ the vast amounts of information placed on the Internet through the deployment of copyright laws, as well as technologically through digital rights management schemes that are protected by quasi-copyright regimes such as the infamous Digital Millennium Copyright Act (DMCA) in the United States.⁵¹ The seemingly inevitable protection of non-original information databases through sui generis proprietary rights further portends a future where access to the most fundamental tools of the information economy will be increasingly problematic as well as economically costly. The enclosure of basic tools required for meaningful access is evident both in the scientific arena as well as in traditional copyright and cultural industries.⁵²

The cumulative cost for each level of access – hardware, inadequate competition and content – requires simultaneous, multi-faceted and strategic policies aimed at addressing the rules that create and sustain the access problem. As is now more appropriately appreciated, the digital divide is a dynamic phenomenon. The various manifestations of the digital divide suggest something incredibly important for public policy initiatives—the divide is a self-sustaining negative externality that will not be constrained or eliminated unless the justifications behind the regulatory policies that influence access on the various levels are restructured to accommodate public welfare interests, including the need for competitive balance in innovation regulation.

3.2 How Economically Significant is the Internet for Developing Countries?

There is currently no general consensus about the economic significance of the Internet with respect to productive activity. Some economists suggest that the Internet is not as revolutionary as other historical technological breakthroughs such as the radio or television.⁵³ Others argue that information technologies and the ubiquitousness of the network have created an unprecedented opportunity to create wealth and to fundamentally transform old economic paradigms.⁵⁴ This debate is likely to continue for some time and only in hindsight can the ongoing impact of the Internet be assessed more accurately. As with most things, it is likely that the truth of the matter is a dynamic located between both extremes. Conventional markets are unlikely to disappear entirely, and there can be beneficial synergies as well as efficiency tradeoffs between electronic and conventional commerce.⁵⁵

Nonetheless, the following examples of noticeable economic effects of the Internet for new markets have

been offered: (i) dramatic reduction in transaction costs; (ii) improved performance of markets; (iii) the creation of markets too difficult and expensive to create without technology; (iv) less costly coordination of economic activity both within firms and in larger economic settings.⁵⁶ The impact of these factors has been felt in peer to peer (P2P) interactions, business to business (B2B) interactions and business to consumer (B2C) interactions. There is considerable evidence that the strong economic growth of the late 1990s in the United States and other OECD countries can be attributed to improved productivity gains in the information technology sector⁵⁷ as well as increased and innovative use of information goods and services.⁵⁸ All this took place in a framework of deregulation, private sector leadership, open publication and sharing of technical information and knowledge, and an impressive collaboration between scientists in different countries.

Box 1: Possible E-Commerce and Information Sharing Relationships⁵⁹

	Government	Business	Consumer	Employee
Government	G2G	G2B	G2C	G2E
Business	B2G	B2B	B2C	B2E
Consumer	C2G	C2B	C2C (peer to peer)	C2E
Employee	E2G	E2B	E2C	E2E

Undoubtedly, information technologies leveraging the Internet and the proliferation of personal computers have ushered in new market structures, new models of competition, and new products in developed countries. The initial commercial uses of the Internet involved merely a transfer of “brick and mortar” services or products to the network and it was unclear whether profits could be sustained with this strategy.⁶⁰ However, for developing countries, simple applications such as email, websites or providing information on-line to customers would have an extraordinary effect in the market. At a minimum, these applications will inevitably up-grade quality and efficiency in the provision of services. Enhanced communications facilitate efficient decision making processes, promote time-savings and streamline the production process.⁶¹ Initial empirical evidence from some developing countries suggests that there are measurable gains even from the simplest

applications of information technologies with significant returns to domestic firms. In South Africa, for example, some firms in the automotive components sector initially used the Internet to process orders, manage inventory, marketing and other inter-firm functions.⁶² While not entirely innovative, this sort of “transfer utility” effectively takes advantage of the transaction cost reductions that characterize economic activity on the Internet.⁶³ These uses require the most minimal capital investment, mainly in hardware and network access, but promises net returns to domestic firms.⁶⁴ A firm’s use of the Internet, for example, can heighten demand by facilitating growth of a larger customer base through advertising and marketing via the company website. There is added value if the website is enhanced to facilitate customer service and other exogenous business development such as automated transactions. It is important to note, however, that

there is a difference between using the Internet to create value and the ability to capture such value. The latter may well depend on macroeconomic conditions that include the presence of well functioning institutions and a functioning telecommunications industry.

In developing countries where entrepreneurial activity has been considerably stymied by inadequate communications infrastructure, application of information technologies will affect domestic investors even if only minimally. The nature of the Internet allows firms to access and utilize technology (host computers) in developed countries for some applications (e.g., websites).⁶⁵ This circumvents, somewhat, the infrastructure barriers in developing countries. However, more meaningful access to telecommunications cannot be avoided in order to fully exploit the potential of the information economy. Studies have shown that better telecommunications infrastructure is both an outcome of economic growth but also an input as well. The causal relationship between the Internet and economic growth appears well established.⁶⁶ It should be noted, however, that synergistic benefits and dynamic welfare effects of information technologies in the domestic market is highly dependent on the existence of a critical mass of users of information technology in a sector or industry. In terms of the value of the network, a single firm's investment in information technology can be a dead weight loss where the rate of connectivity in the relevant sector is low. Further, participation in global value chains requires effective integration of information technologies in local firms.⁶⁷ Export oriented firms in developing countries are particularly imperilled in this new economy if they lack access to networks. As sectors in developed countries experiment with new business models based on the Internet, the reorganization of the global supply chain in response to technological innovation will inexorably require firms in developing countries to integrate information technologies in domestic operations, even if just to avoid the very real threat of becoming irrelevant. Thus, what is important is for firms and countries to evaluate sectors where information technologies offer opportunities to enhance comparative advantage, add value to existing products and services, and in other ways facilitating participation in the global value chain.⁶⁸

With respect to the global value chain, the importance of e-commerce to economies in the developed world is reflected by data about the proportionate share of GDP attributable to growth of the information technology

sector in OECD countries.⁶⁹ According to the United States Census Bureau, retail e-commerce sales in the first quarter of 2003 were US\$11.9 billion, accounting for 1.5% of total sales.⁷⁰ This is a 25.9% increase from the first quarter of the previous year. By 2004, e-commerce revenues in the United States are expected to reach US\$1.01 trillion.⁷¹ As of 2001, total e-commerce revenues in the EU were reported as \$172 billion Euros.⁷² E-commerce statistics are difficult to compile in developing countries. However, in some leading developing countries such as Brazil, e-commerce revenues were expected to reach US\$ 255 million.⁷³ For Chile, the B2B transactions were expected to rise significantly from US\$ 1.5 billion in 2001.⁷⁴ In South Africa, B2C sales were expected to total US\$ 27.9 million in 2002, up from US\$ 16.7 million in 2001.⁷⁵

For all other countries, particularly the least developed countries (LDCs), e-commerce rates are negligible as these are directly related to the availability of computers, internet access points and the presence of "soft" infrastructure such as education, language skills, etc.

Box 2: E-Commerce Sales in 2004 by Region

United States	\$3.2 trillion
Asia-Pacific	\$1.6 trillion
Western Europe	\$1.5 trillion
Eastern Europe, Africa, Middle East	\$68.6 billion
Latin America	\$82 billion

Indeed, as of 1999 one report indicated only one Internet user for every 250 persons in Africa.⁷⁶ The global ratio then was estimated as one user for every 35 persons while in the United States and European Union, the ratio was one user per three persons. By 2002, other reports suggested a further decline in comparative use rates: 1 user for every 250-400 persons in Africa compared to a world average of 1 user for every 15 persons, and in the United States and EU 1 user per 2 persons.⁷⁷ However, major countries such as Egypt, Nigeria, and South Africa have boosted regional numbers of use and access in recent years.⁷⁸

Telecommunications availability is clearly a critical factor in evaluating prospects for using information technology to facilitate economic goals in the digital age.⁷⁹ Despite the emergence of new technologies for

Internet access, the fact still remains that most individuals access the Internet through telephone networks.⁸⁰ Interestingly, one report of ICT trends in Africa indicate that mobile phone adoption has surpassed fixed line use for communication.⁸¹ As mobile technology evolves, important possibilities for developing countries in overcoming the significant problem of Internet access will likely emerge.⁸² There is already some evidence of the importance of mobile phones in economic and social empowerment in rural communities in South Asia.⁸³ If mobile phone use in developing countries surpasses access and use of traditional telephones and wireless application protocols, it would seem that the possibility of mobile Internet access is a more promising prospect for enhanced Internet use in developing and least developed countries. As technology evolves, there is no doubt that Internet access through a variety of means, mobile, cable, telephone, satellite and wireless,⁸⁴ will be of great importance in facilitating access to the information economy for developing and least developed countries. Indeed, competition between these services will be vital for ensuring pricing options that are feasible for consumers in these countries.

Despite data about Internet penetration rates in developing countries that may suggest that short-term prospects for developing countries are bleak, the fact is that economic opportunities in the information economy extends to activities beyond those empowered by information technology. Developing countries such as India have experienced significant information technology-related economic growth despite low Internet penetration. In the year 2000, the Indian information technology industry was reportedly a US\$10

billion industry comprising hardware and software.⁸⁵ By 2001/02, exports of software and services had experienced incredible double-digit growth, and India now constitutes almost 80% of the outsourcing market.⁸⁶ India's notable experience with information technology provides important insights into why traditional barriers to economic growth and development, such as inadequate physical infrastructure and lack of technology, may not inevitably constitute insurmountable barriers to the potential for developing countries to benefit from the information age.⁸⁷ However, it is also important to note that the viability of supply side value added components to the global value chain in software cannot sustain widespread economic growth.⁸⁸ Two key factors are worth considering. First, exploitation of cheap but highly skilled labour is highly dependent on domestic regulation in *developed* countries. The current regulatory environment for outsourcing is vulnerable to protectionist pressures particularly in the current economic downturn in countries such as the United States.⁸⁹ Second, total factor productivity,⁹⁰ a robust measurement of economic growth, is likely to be significant in developing countries chiefly via meaningful diffusion and access to technology for domestic industries. Although there is evidence of some positive externalities in India's success in the outsourcing business⁹¹ the point still remains that sustained, dynamic growth will require fundamental shifts in the productive capacity of the country.⁹² Thus, Internet access, use and the development of local content and content providers remain important regulatory issues for countries committed to pursuing development opportunities.

Table 1: Internet World Usage STATISTICS⁹³ (Usage and Population by Countries and Regions)

World Regions	Population (2003)	Usage (Year 2000)	Usage Latest Data	(%) Table	Growth (2000-2003)	% Population (Penetration)
Africa	879,855,500	4,514,400	8,073,500	1.2 %	78.8 %	0.9 %
America	864,854,400	126,164,800	228,775,858	35.1 %	81.3 %	26.5 %
Asia	3,590,196,700	114,303,000	200,319,063	30.7 %	75.3 %	5.6 %
Europe	722,509,070	103,075,900	190,297,994	29.2 %	84.6 %	26.3 %
Middle East	259,318,000	5,272,300	12,019,600	1.8 %	128.0 %	4.6 %
Oceania	31,528,840	7,619,500	13,058,832	2.0 %	71.3 %	41.4 %
WORLD TOTAL	6,348,262,510	360,949,900	652,544,847	100.0 %	80.8 %	10.3 %

Table 2⁹⁴: Total Number of People Age 2 and Older with Internet Access via Home PC

	Number of People with Internet Access (in Millions)	% of World's Internet Population
US	168.1	29
Europe	135.3	23
Asia & Pacific	75.5	13
Latin America	14.3	2
Rest of World	186.8	33
Total	580	100

To conclude, it is no surprise that Internet growth and access rates in developed countries are significantly larger than in developing countries. The significant disparities have led some commentators to suggest that developing countries can benefit only limitedly from the information economy. This view assumes a static view of Internet penetration in developing countries as well as a narrow perspective of what different applications

of information technology can offer developing countries. The overall data reflects *some* growth in Internet access and use in developing countries, suggesting that the Internet and its associated information technologies can offer important economic development opportunities in the current environment notwithstanding comparatively low levels of access.

3.3. A Brief History of the Development of the Internet and the Role of the Regulatory Environment in Innovation and Technology Diffusion

In addition to constituting a unique marketplace where buyers and sellers interact,⁹⁵ there are two possible categories of economic activity attributable to the Internet: (1) business activity related to the development of complementary hardware and associated tools that facilitate access and use of the network; (2) business activity associated with the development of new goods and services. These can be generally referred to respectively as “complementary markets” and “innovation markets”. Ideally, innovation markets create multiple secondary markets that, after consolidation, establish the foundation for subsequent generations of innovation. The Internet confirms this process of technological evolution and its spillover effects.

There are many existing accounts of the history and development of the Internet. This section briefly summarizes the significant moments of this history, emphasizing the regulatory and technological environment that facilitated the growth of the network system and ensured its establishment as the engine of the information age. It is important to note at the outset that there can be no “finished” account of the development of the Internet. The Internet continues to benefit from ongoing technological innovation and

adaptation. Nonetheless, there is an important technological genesis of the information revolution and briefly identifying the historical framework provides an important context in which current regulatory initiatives can be evaluated.

The origins of the interactive system of linked computer networks now commonly known as the “Internet” dates back to the 1960’s in the United States when a decentralized computer communications network was developed to facilitate electronic communication and cooperation among a group of scientists, government defense contractors, and universities.⁹⁶ This initial endeavour was enlarged over the years by the development and adoption of the Transmission Control Protocol/Internet Protocol (TCP/IP) as the dominant standard of the network system.⁹⁷ Open access to the specifications of Internet protocols has been identified as a key factor in the rapid growth of the Internet. The TCP/IP specifications were put in the public domain by the authors in 1974.⁹⁸ Other ideas essential for creating networks were also widely shared among network scientists and researchers, first via regular mail and then, as technology developed, through online delivery.⁹⁹

From a primarily government sponsored project of the 1960s, the phenomenon of inter-computer communications, and the network it engendered, was broadened during the 1980s by the development of regional and local networks facilitated by NSFnet, a network sponsored by the National Science Foundation (NSF) to facilitate academic research, collaboration and exchange.¹⁰⁰ This academic vision extended to universities and research agencies well beyond the United States. Indeed, networks using the same “packet switching” technology had been deployed for civilian use in some parts of Europe around the same time as the initial defense funded network in the United States. Available evidence suggests that funding difficulties stymied these early European networks.¹⁰¹

Academic use in the United States, however, could not be limited to formal institutions. In particular, use of the network for communication by e-mail became dominant as students moved from universities to the employment arena.¹⁰² By the 1990s, corporate use of the Internet proliferated and commercial users and applications began to consume much of the capacity of NSFnet.¹⁰³ As the open network architecture of the Internet continued to develop through the collaborative work of scientists in Europe and the United States, the open system adopted by researchers very early in the development of the technology facilitated the world wide growth of networks.¹⁰⁴ According to some accounts, by the mid-1990s, the Internet had grown to consist of about 50,000 networks spanning all seven continents.¹⁰⁵ To facilitate the increase in communications traffic, alternative sources of connectivity to the Internet were developed by commercial entities who eventually became major Internet Service Providers (ISPs).¹⁰⁶ By 1995, commercial and social uses of the Internet dominated the network; its initial character as a government or academic phenomenon had been completely transformed.¹⁰⁷

The invention of the World Wide Web (Web) further radically propelled the growth of Internet relevance and use in the broader society. Simply defined, the Web is a set of software document format and retrieval protocols with multimedia properties that facilitate inclusion of graphics into the text of documents.¹⁰⁸ Fundamentally, the Web is an access tool that tremendously magnified the value of the network to all users by facilitating placement, search, and access to the vast amount of material on the Internet. This particular technological development catalysed the commercialisation of the

Internet particularly with the introduction of the Netscape browser in 1994.¹⁰⁹ At the time, the strong economy in the United States channelled equity funds to new firms investing in information technology of almost any type, resulting in a macroeconomic environment that heavily emphasized commercial activities made possible or better by the development of software and hardware that would complement and/or leverage the technical infrastructure of the Internet. Other important features associated with this particular period include the deregulation of the telecommunications industry and the related use of antitrust policy to engender competition in the provision of network access and services.¹¹⁰

In sum, four important developments made possible the rapid adoption of the network for commercial transactions and a wide range of social activity:

- The non-proprietary approach to innovation and information;
- The standardization of the Internet networking computer protocol;
- The privatisation of the network as deregulation made it possible for independent telecommunications companies to provide connectivity;
- The introduction of the World Wide Web.

The increasing availability and use of personal computers in the United States ensured a synergy between the underlying infrastructure of the Internet, and software applications for a number of different uses. Additionally, a system emerged for organizing “domains” of specific activity on host computers.¹¹¹ Domain names typically denote the nature of activity of a particular Internet user. By most accounts, the commercial domain (“dotcom”) has been the fastest growing segment of the Internet since 1995. One source states that by 1996, the commercial domains had almost twice as many hosts as the educational domain, and by the year 2000, Internet businesses and the commercial domains accounted for more than six times as many hosts as the educational domain.¹¹²

With respect to the nature of commercial activity on the Internet, it is interesting to note the industries most affected by innovations in communication technologies. These industries are associated primarily with data processing such as in insurance, financial markets, health care management, electronic shopping, auction systems, and business cryptography. As will be discussed

later, these are the same areas in which business method patent applications predominate. Proprietary protection of databases will also have an impact in these markets. Further, as noted earlier, forms of commercial activity at initial stages of electronic business and commerce are typified less by innovative strategies

Table 3: The Development of The Internet At A Glance

Stages	Funding and Technology Environment	Innovation Environment	Critical Technologies or Applications	Regulatory Framework
<i>Initiation and Development</i>	<ul style="list-style-type: none"> - Defense related funding (DoD) - Public funding (NSF) 	<ul style="list-style-type: none"> - Established R&D infrastructure consisting of a network of trained researchers; ARPANET - documentation through RFC's; open access specifications of protocols 	<ul style="list-style-type: none"> - hardware research (transistors) - Packet-switching - computer program languages (e.g., Assembly, C and FORTRAN) - theoretical foundations for TCP/IP File Transfer Protocol (FTP) E-mail 	<ul style="list-style-type: none"> - Collaborative relationships between academic, government and industrial researchers - Strong computer hardware and software industries with some reliance on intellectual property laws (trade secrets, copyrights and patents)
<i>Standardization and Privatisation</i>	<ul style="list-style-type: none"> - Private funding - Financial investments by educational institutions 	<ul style="list-style-type: none"> Rise of standard setting bodies/trade associations such as IEEE, ACM, W3C. 	<ul style="list-style-type: none"> - UNIX - development and adoption of TCP/IP - E-mail (Simple Mail Transfer Protocol) - Telnet - Ethernet technology - World Wide Web (Hypertext transfer protocol; Hypertext Markup Language) - Mosaic browser (visual interface) - Java 	<ul style="list-style-type: none"> - Designation of Network Access Points (NAPs) for interconnectivity by commercial backbone operators. - Antitrust and regulatory policies facilitated emergence of domestic ISPs. These policies had the effect of weakening the market power of telecommunications companies.
<i>Commercialisation</i>	<ul style="list-style-type: none"> Private funding Public/private partnerships 	<ul style="list-style-type: none"> Open Source movement 	<ul style="list-style-type: none"> - Windows - Netscape - Database applications (e.g., Oracle, SQL) - Linux - embedded technology/firmware (e.g., PDA's, cell phones and other real time systems) - broadband (high speed internet) 	<ul style="list-style-type: none"> - Use of antitrust to ensure competition, however still highly concentrated industry for cable and phone lines; multilateral cooperation in regional and international bodies such as OECD - Open Source General Public License (GPL) putting pressure on proprietary systems. Increasing adoption of open source by governments and businesses.

than by the use of automated systems and technology to enhance existing business models, products and services.¹¹³ Analysts and scholars do, however, anticipate the emergence of transformative applications of information technologies to generate new forms of businesses and entrepreneurial activity. One of the most active commercial applications of the Internet involves

auction systems/other electronic shopping activities and financial services.¹¹⁴

The regulatory, policy, and macroeconomic environment that facilitated the initial adoption / adaptation of the Internet for commercial and social use is depicted in *table 3*.

3.4 Regulatory and Legal Issues: A Summary

The interdependence of national economies occasioned by free trade agreements has been deepened through the agency of technological networks that even more closely integrate economic processes. Developing countries did not play a significant role in the technical architecture of the Internet; however, they must play a role in determining how access to the Internet, in all its various permutations, will enhance their capacity and opportunity for effective improvement of the quality of life for their citizens. In this regard, multilateral negotiations to establish global regulatory norms are a pivotal forum to advance principles that encourage competition in the Internet through balanced intellectual property rights. It is thus important to understand how intellectual property rights affect behaviour, practices and opportunities on the Internet.¹¹⁵

As the preceding discussion suggests, macroeconomic factors are of critical importance to facilitate sustained economic growth in developing countries. Important regulatory and legal rules facilitated the transformation and development of the Internet into a viable and secure environment for a variety of economic and social activities. Although the rules governing behaviour on the Internet remain fluid, several important topics have been the subject of government attention.

1. *Telecommunications*: The Internet integrates features of the telephone, radio, television and personal computers. Consequently, regulatory principles dealing with competition in the telecommunications industry had to be established as traditional lines between these products became blurred. In 1996, the U.S. Congress passed the Telecommunications Act¹¹⁶ which sought to balance competition between providers of these hitherto disparate products who were pursuing ways to upgrade their services to the new

information age. The deregulation of the telecommunications infrastructure and antitrust oversight of new mergers between traditional media companies and information technology companies has been an important feature of the regulatory environment of the information age in most developed countries.¹¹⁷

2. *Copyright*: The ability of millions of users to move vast amounts of data over fibre optic lines or even conventional telephone lines, and thus to exchange literary and artistic works without restrictions imposed by time, geography or reduced quality, has had a profound effect on copyright law. Copyright owners quickly realized the vulnerability of works to widespread infringement through the dissemination capacity of the Internet. Consequently, negotiations at the World Intellectual Property Organization (WIPO) led to two international agreements designed to address the digital age. The WIPO Copyright Treaty (WCT) and the WIPO Performers and Phonograms Treaty (WPPT) both entered into effect in 2002.¹¹⁸ Implementation of the WIPO Internet treaties in the United States was effectuated through the Digital Millennium Copyright Act (DMCA),¹¹⁹ arguably a much more restrictive approach to copyright in the digital information age than what is required by the treaties.¹²⁰ Nonetheless, this highly controversial model is fast becoming a global standard through the instrumentality of regional free trade agreements and bilateral accords.¹²¹ Changes in this area of law have been significant and controversial on a global scale. Interestingly, it has also transformed the traditional divide between developed and developing countries by aggregating public interest concerns on a global scale to oppose unjustifiable expansions of copyright.¹²²

3. *File-swapping software, new formats and related issues*: The use of file-swapping software that facilitates access to songs, movies and other digital content directly from servers and computer hard drives, and new media formats such as MP3 files, has raised important questions about the responsibility and liability of ISPs to clients and copyright owners. As ISPs are caught between owners and users, privacy rights are also implicated as rights owners aggressively seek to enforce their rights in a digital environment.¹²³
4. *Business Method Patents*: In addition to technology enabled processes to create new products and markets, the Internet has also occasioned new strategies by which transactions may take place. Consumers can enjoy the benefits of financial services online, including the ability to purchase goods electronically, and businesses can use computer-aided design to facilitate production and reduce inefficiencies and costs by replacing human capital with automated systems. Recently, computer implemented business methods have been patented, thus giving exclusive rights to a particular method of doing business.¹²⁴ Notable examples are Amazon.com's infamous "one-click" method of online purchasing,¹²⁵ Priceline.com's patent on reverse auctioning,¹²⁶ and E-Bay's patent for an apparatus and method for organizing and presenting information for its trading environment.¹²⁷ Business method patents have proven very controversial, with proponents arguing that such patents encourage investments in innovation in the information age and opponents countering that such patents discourage productivity and stifle innovation.¹²⁸ Unbridled extensions of proprietary rights to new organizational strategies or business models have implications for inter-firm competition online. In some cases, it will also affect how consumers can access content on the Internet.
5. *Other regulatory areas*: In addition to complex intellectual property issues, there remain a number of regulatory concerns that will affect technology-enabled development goals. From a global perspective, an important topic is antitrust regulation of dominant information technology companies. Antitrust concerns were made prominent by the U.S. Justice Department's lawsuit against software giant Microsoft.¹²⁹ Recently, the EU also indicated displeasure with this global software powerhouse,¹³⁰ while a group of Asian countries have proposed developing a competing technological platform to Microsoft's operating system based on Open Source.¹³¹ Other regulatory concerns include: security and privacy for commercial transactions; the protection of personal data; the use and legality of electronic signatures for e-commerce transactions; encryption regulation; technical standards and the process of standard setting; taxation of digitised products; and the ubiquitous problem of legal jurisdiction for activity that takes place on-line. There have been some developments at national and multilateral fora on some of these topics.¹³²

4. COMPUTER SOFTWARE PROTECTION, COMPUTER DATABASES & E-COMMERCE

4.1 Patents on Business Methods: Is this the Way?

Traditionally, patent law in most developed countries has focused on industrial inventions and devices. Methods of doing business, explicitly excluded from patentability in the EPC, were not statutorily precluded from patent protection under United States law but were perceived to be patent-ineligible under a judicially derived “business method exception” to patentability.¹³³ However, in 1998, the United States Court of Appeals for the Federal Circuit, in dicta, laid the business method exception to rest and declared such subject matter to be patent-eligible on the same basis as any other process.¹³⁴ Shortly before this decision, the United States Patent and Trademark Office (USPTO) issued its “Examination Guidelines for Computer-Related Inventions” and relaxed its opposition to business-method patents.¹³⁵ Earlier versions of the Guidelines precluded patent examiners from accepting claims directed to methods of doing business although, at the time, it explicitly recognized there was no legal basis for such rejections.¹³⁶ It thus appears that the USPTO’s original position was to preserve business methods for the public domain. In the wake of the change in direction by the courts and the USPTO, there was a dramatic surge in patent applications for business methods. An OECD report states that patents related to information technologies grew at a 10% rate during the 1990’s and by 1998, such patents represented 16% of the total OECD patent applications.¹³⁷ The increase in the annual growth rates of these patents was concentrated primarily in the United States and Europe.¹³⁸ These observations should be qualified by the fact that not all patents that issue in the information technology category are necessarily “business method” patents, although a great deal of such patents will affect business methods generally. Consequently, it is important to note for policy purposes, that while business method patents represent an immediate concern for development interests, the broader class of patents that involve the information technology sector can also negatively affect access to the benefits of computer networks.

Business method patents can be described using three categories.¹³⁹ First, there is the computer business method category, which includes patent claims that are associated with using computers to perform traditional

business functions, which were previously done without computers. A second category is the e-commerce category, which deals with patent claims that involve Internet applications and e-commerce, such as a patent granted for reverse auctioning on-line,¹⁴⁰ or the one-click order patent owned by Amazon.com.¹⁴¹ A third category is simply other new business methods outside of software or the Internet areas. These include non-technical fields such as coupon distribution, advertising, insurance, accounting and a number of other such fields where the patent system has not historically played a major role. Indeed, until the recent change of direction, which affirmed patents for business methods, the business community did not really consider patents as a significant factor in the development and accumulation of capital. This is particularly true of small and medium enterprises (SMEs).¹⁴²

The extension of patents to business methods has proven very controversial in the United States. Congress intervened with amending legislation in an attempt to clarify the scope of business method patents.¹⁴³ Most important, there has been concern about the inhibiting effect such patents may have on the development of e-commerce and innovation in the on-line environment.¹⁴⁴ Statistics indicate that e-commerce related business method patents are the fastest growing category of business method patent applications and constitute a significant threat to the digital economy.¹⁴⁵ There are also practical considerations that must be weighed. The number of business method patent applications has added an enormous burden to the administration of the patent system in the United States. Several organizational changes have been made in order to respond to the increase in filings.¹⁴⁶ Additionally, several legislative amendments have been introduced to deal with the policy concerns about “glutting” the patent system and stifling innovation for e-commerce. Following the decision in *State Street*, statistics indicate that business method patents are much more likely to be litigated than any other category of patents.¹⁴⁷ Indeed, in the United States software patents have had higher litigation rates than non-software patents.¹⁴⁸

The requirements for general patentability impose some constraints on the practical grant of business method

patents in the EU. Patents are available for inventions that are susceptible of industrial application, new and that involve an inventive step.¹⁴⁹ To satisfy the definition of “susceptible to industrial application,” the European Patent Convention (EPC) provides that an invention should be capable of being “made or used in any kind of industry, including agriculture.”¹⁵⁰ Explicitly excluded from consideration as an “invention” are the following: discoveries, scientific theories and mathematical methods; aesthetic creations; schemes, rules and methods for performing mental acts, playing games or doing business and programs for computers; presentations of information.¹⁵¹ These exclusions are applicable only to the extent a European patent application or European patent relates to such subject-matter or activities.¹⁵²

In addition to these exclusions, rules that require that claims be drafted in terms of an invention’s technical features *and* in terms that define a technical problem and its solution appear to impede the patentability of business method patents in the EPO.¹⁵³ However, there have been numerous patents granted for software-implemented inventions for business activities and other purposes where the claimed invention satisfies the criteria of being a technical contribution to the art.¹⁵⁴ A technical contribution to the art can be found in a number of things including: increased performance or productivity, a system which enables automated operations of functions that previously could only be done by physical labour, a system with reduced costs, and a system which simplifies the steps necessary to achieve a particular result. Such technical contribution will sustain the patentability of a business method innovation before the European Patent Office (EPO).¹⁵⁵ In one decision, the EPO Board of Appeal held that the technical contribution that informs the basis upon which a patent is granted may derive from the problem that is to be solved, the implementation of the solution, and the function or effects of the implementation.¹⁵⁶ This broad and flexible range of possible contributions has resulted in patents being granted by the EPO for innovations in software that have a direct effect on business management or operations (such as business management systems)¹⁵⁷ and those that have an indirect effect on business enterprises simply by enhancing the functioning of a computer system or the ease with which individuals can perform specified functions.¹⁵⁸

Despite what appears to be a liberal approach by the EPO in the interpretation of the principles that affect

the patentability of software as it relates to business methods or e-commerce, it is important to keep in mind that decisions about the patentability of business models are also made at the national level.¹⁵⁹ In this regard, the case law has been mixed, reflecting at best, ambivalence about the wisdom and appropriateness of granting business method patents on a large scale basis. It is likely that patent offices in developed countries will be cautious about the conditions under which such patents are issued. The United States, for example, has reportedly witnessed a decline in the grant of business method patents following organizational changes that established a second level of review of the class in which business method applications are predominant.¹⁶⁰ However, it should also be noted that there are current attempts in the EU to extend patent protection to computer software.¹⁶¹ This proposal was justified by reference to the contribution of software development to European GDP, and the importance of e-commerce in the information economy. The proposal, which recognizes that computer programs “as such” are ineligible for protection, would nevertheless have a liberalizing effect on business method patents although the proposal clearly goes further than this subject. The explanatory memorandum offered by the Commission makes explicit reference to the judicial endorsement of business method patents in the United States, thus clearly suggesting that business method patents are included in the scope of “computer-implemented inventions”. The proposal has been modified by the European Parliament, but the final outcome remains uncertain in light of the legislative stages that lie ahead of the current bill.

For developing countries, the protection of business method patents is not advisable for a number of important reasons.¹⁶² Empirical evidence does not establish that business method patents have a singularly positive effect on innovation. Indeed, the EU and countries such as Japan and Australia have all proceeded with notable caution in their respective policies about granting business method patents.¹⁶³ As mentioned earlier, even in the United States, there has been important adverse public reaction to the grant of business method patents. In developing countries where resources to devote to intellectual property administration are already barely existent, and where there is limited availability of trained technical personnel to service patent offices, there is hardly any legitimate basis to recognize such patents. While the TRIPS Agreement prohibits discrimination against a field of

technology, it is arguably the case that business methods do not satisfy the minimum requirements of Article 27.¹⁶⁴ National patent offices in developing countries, and regional patent offices that handle patent applications for developing and least developed countries, should strictly apply the minimum requirement of “capable of industrial application” in evaluating the legitimacy of an application for any process that essentially constitutes a business method. Even where this requirement is satisfied, it is important that claims

be carefully scrutinized so that the scope of protection is limited to aspects of the innovation that fully satisfy all requirements for patentability. This will ensure that for those countries where macroeconomic conditions are conducive to commercial activity utilizing the Internet, domestic players are not stifled by proprietary interests that prohibit the adoption of certain business strategies simply because such strategies may be covered by a patent issued elsewhere.¹⁶⁵

4.2 Database Protection: Some Considerations for Development

Digital data and technologically enabled tools for aggregating, sorting and classifying such data constitutes one of the most significant areas of e-commerce.¹⁶⁶ Most service industries rely significantly on electronic compilations of data. Generally, unoriginal collections of data have fallen outside the purview of copyright protection.¹⁶⁷ In 1996, the EU passed the Directive on the Legal Protection of Databases (Database Directive),¹⁶⁸ which established a *sui generis* form of protection for the contents of databases.¹⁶⁹ Together with extant protection for compilations, which the Directive also harmonized, and a controversial provision, which extends protection of databases to nationals or habitual residents of non-EU countries, data protection under a proprietary regime has become an important part of the regulatory environment of the information age. Shortly after the EU Directive was passed, a bill directed at creating a similar *sui generis* regime for databases was introduced in the United States Congress.¹⁷⁰ The European model was opposed by several important constituents of the public including scientific organizations, educational institutions and academic organizations. These groups cited the notable adverse effects of a property-based model of protection on scientific research, scholarly activity and education.¹⁷¹ Internet based enterprises also opposed *sui generis* database protection on grounds that such protection will lead to even greater industry concentration and increase the costs of e-commerce by simultaneously lowering the utility and increasing the cost of search engines. The result would be reduced competition on the Internet due to heightened barriers of entry to e-markets and inhibiting second-generation improvements to existing databases. A series of intense and prolonged negotiations commenced between affected interest groups but despite numerous iterations of the initial proposed legislation, no database

protection bill has yet been passed by Congress. However, there are ongoing efforts to secure such legislation at some point in the future.¹⁷²

The possibility of an international agreement to protect databases was introduced under the auspices of the World Intellectual Property Organization (WIPO).¹⁷³ Developing countries, in concert with public interest groups in developed countries requested an in-depth study of the economic impact of database protection and generally opposed any international treaty on the subject until a full analysis of the economic impact of such protection could be thoroughly investigated. The results of the studies seem to have produced a political and intellectual impasse about the impact of a global treaty for database protection.¹⁷⁴ However, as the United States currently pursues domestic database legislation, it is certain that initiatives for a global agreement will arise in the future.

Despite the absence of a formal database law in the United States, and the absence of an international treaty for database protection, several different legal rules can and do provide a measure of protection for otherwise non-copyrightable content. The most prominent of these is the common law of unfair competition or tort of misappropriation¹⁷⁵ recognized in most common law jurisdictions including many developing and least developed countries. Additionally, database owners may utilize contractual agreements to preclude users of data from copying or otherwise distributing the data. Such contractual arrangements have been enforced by courts in the United States.¹⁷⁶ Further, owners of databases may rely on technological protections legitimized by laws such as the DMCA and ostensibly sanctioned by the WCT, to preclude access to database content.

The DMCA prohibits the circumvention of technological measures used to prevent unauthorized access to or use of a protected work.¹⁷⁷ The DMCA also prohibits trafficking in tools that might be used to disable such copy protection.¹⁷⁸ These controversial provisions of the DMCA¹⁷⁹ have been heavily criticized as overprotective and lacking in any limitations to protect legitimate uses of content protected by technological means.¹⁸⁰ For example, the DMCA does not admit strong fair use

exceptions or other limitations that arguably preserve the important balance between public and private interest in digital content.¹⁸¹ Important public welfare issues implicated by the DMCA model include: the ability of competitors to create software products for purposes of interoperability, encryption research and security testing,¹⁸² and control over complementary markets.¹⁸³ On the other hand, the EU model of the WCT contains room for flexibility for member states

Table 4: Developing Countries and the WIPO Internet Treaties: A Matrix¹⁸⁴

Country	WPPT member	WCT member	Developing/Least Developed	TRIPS member	Internet Usage	Internet Penetration
Albania	Yes	No	Developing	Yes	10,000	0.3%
Argentina	Yes	Yes	Developing	Yes	4,100,000	11.1%
Belarus	Yes	Yes	Developing	No	808,700	8.1%
Bulgaria	Yes	Yes	Developing	Yes	605,000	7.6%
Burkina Faso	Yes	Yes	Least developed	Yes	19,000	0.2%
Chile	Yes	Yes	Developing	Yes	3,102,200	20.3%
Columbia	Yes	Yes	Developing	Yes	1,982,000	4.5%
Costa Rica	Yes	Yes	Developing	Yes	384,000	9.3%
Croatia	Yes	Yes	Developing	Yes	789,000	17.9%
Cyprus	No	Yes	Developing	Yes	210,000	22.5%
Ecuador	Yes	Yes	Developing	Yes	503,300	4.0%
El Salvador	Yes	Yes	Developing	Yes	300,000	4.9%
Gabon	Yes	Yes	Developing	Yes	25,000	1.9%
Georgia	Yes	Yes	Developing	Yes	73,500	1.4%
Guatemala	Yes	Yes	Developing	Yes	200,000	1.4%
Guinea	Yes	Yes	Least developed	Yes	15,000	0.2%
Honduras	Yes	Yes	Developing	Yes	200,000	3.0%
Jamaica	Yes	Yes	Developing	Yes	100,000	3.6%
Jordan ¹⁸⁵	No	No	Developing	Yes	432,000	4.2%
Kyrgyzstan	Yes	Yes	Developing	Yes	152,000	2.9%
Mali	Yes	Yes	Least developed	Yes	30,000	0.3%
Mongolia	Yes	Yes	Developing	Yes	40,000	1.6%
Nicaragua	Yes	Yes	Developing	Yes	200,000	3.0%
Panama	Yes	Yes	Developing	Yes	90,000	1.6%
Paraguay	Yes	Yes	Developing	Yes	100,000	1.7%
Peru	Yes	Yes	Developing	Yes	2,000,000	7.4%
Philippines	Yes	Yes	Developing	Yes	2,000,000	2.4%
St. Lucia	Yes	Yes	Developing	Yes	3,000	1.9%
Senegal	Yes	Yes	Developing	Yes	105,000	1.0%
Slovenia	Yes	Yes	Developing	Yes	800,000	41.0%
Togo	Yes	Yes	Least developed	Yes	200,000	3.9%

to consider enacting limitations and exceptions that are consistent with those provided by national law.¹⁸⁶

Notwithstanding the significant criticism of the DMCA, a series of bilateral trade agreements negotiated by the United States have included DMCA like provisions, and thus made these inordinately high standards a *de facto* model for global implementation of the WCT.¹⁸⁷ The combined effect of private law mechanisms such as torts and contract law, and public law regulation through copyright and other specialized regimes like the DMCA, will lead inevitably to increased difficulty in access to content. In a situation where access to hardware is already an important hindrance to developing countries, adding another layer of impediments, and inevitably raising costs, is problematic for the interests of developing countries in utilizing information technology. Ironically, the majority of countries who joined these WIPO Internet treaties, thus making it possible for them to enter into force, were developing countries.

It is interesting to consider why so many developing countries, even those with no free trade agreements at stake, ratified the WIPO Internet Treaties. This is particularly intriguing since the “low” (in terms of users) and “slow” (in terms of dial up access) Internet connectivity rates in developing and least developed countries make it highly unlikely that widespread access to digital content in these countries is a significant threat to copyright owners.

One explanation could be the assumption that access in these countries will increase as new technologies overtake reliance on telephone lines which are weak or non-existent in many developing countries.

Consequently, securing ratification of these treaties is a strategically pre-emptive move on the part of rights owners. Further, ratification by developing and least developed countries may serve to curtail the rise of peer to peer file sharing services whose location outside of the United States can raise jurisdictional difficulties for purposes of prosecution for copyright infringement.¹⁸⁸ In theory, a multilateral treaty that requires governments to enforce copyright interests on computer networks will create a legitimate lever for developed countries to pressure governments in developing and least developed countries to take domestic enforcement action. Another noteworthy point is that the minimal levels of use and users in these countries means that there is currently no identifiable “public” immediately affected by these treaties. Consequently, ratification by such countries is a politically and legally costless gesture.¹⁸⁹

However, recent proposals to integrate the WIPO Internet Treaties in the corpus of the TRIPS Agreement will alter this landscape significantly. At the very least, such integration will raise the costs of access indirectly by constraining policy spaces for developing countries to promote domestic policies that are consistent with their national interests as is currently the case under the TRIPS Agreement.¹⁹⁰ The spectre of the WTO dispute settlement process may also occasion side-bargains by way of even more expansive protections not contemplated by the TRIPS Agreement or the WIPO Internet Treaties.¹⁹¹ Thus, for example, for countries in which bilateral trade agreements do not serve as a channel for introducing significant copyright protection, an expansion of TRIPS to encompass the WCT and WPPT could accomplish a worst case scenario by making the expansionist copyright model an enforceable global regime.

5. DEVELOPMENT OPPORTUNITIES AND STRATEGIES

Successful utilization of the benefits of the information age requires a dynamic balance between multiple policy elements including the regulatory environment, macro-economic strategies in areas such as human capital development, and the effect of intellectual property rights on access to and use of digital content. As the history of the Internet illustrates, the regulatory environment is a critical component of both the physical infrastructure of the network that empowers applications of software for the information economy, as well as the macroeconomic environment in which the development, use and dissemination of products and services take place. Indeed, economic and empirical studies of the contributions of information technology to growth in some developed countries indicate that mere capital investment in the technological infrastructure is insufficient.¹⁹² Such investments must be

accompanied by the willingness of firms to adjust organizational structures to new technology-empowered methods,¹⁹³ the willingness and possibility of introducing labour to new systems of production and management, the development of appropriate regulations regarding education, employee mobility, and competition between firms.¹⁹⁴ The limited gains from investments solely in Internet infrastructure point squarely to the relatively high importance of balance in the rules that govern productive and consumptive activity online. The chart below illustrates some linkages between intellectual property rights and technology-enabled gains. As illustrated, if not carefully balanced by robust access rights, proprietary rights can erode important benefits made possible by investments in acquiring technology hardware.

Table 5: Intellectual Property and the Internet: Mapping a Critical Relationship

Internet-enabled gain	Intellectual Property Right	Implications/Policy Concerns
Wide spread, low cost access to distribution of information. New uses of technology, such as webcasting	Copyright in literary works precludes unauthorized copies, derivative works, and distribution. On the Internet, multiple infringements of copyright can occur in simple acts such as uploading, downloading or forwarding documents. For musical and audiovisual works, copyright prohibits, <i>inter alia</i> , unauthorized performances, transmissions and broadcasts.	Without robust limitations, copyright may affect use of the Internet for educational and other public purposes. Copyright constrains widest possible dissemination, or substantially raises the cost of such dissemination.
Ease of locating documents on-line through linking; reduced transaction costs	Trademark and Copyright interests have been asserted to preclude linking to other websites. Common law theories and contractual provisions have also been used to prevent access to websites and/or information.	Inhibits competition by raising transaction costs of locating and comparing information on-line.
Free access to unoriginal compilations of data	Database Protection	Raises cost of access and imposes cost on use. When combined with DMCA rights, may impede access completely.
New organizational structures/business models	Business Method Patents	Raises entry barriers; inhibits competition; raises uncertainty for would-be entrants to e-markets and may reduce overall efficiency.

5.1 Broad Applications of Information Technology

Information technology has been applied to enhance four major categories of activities: governance, growth and supply/distribution of goods and services, adding value to existing services and the creation of new products and services. The range of activities that can benefit from information technology appears to be unlimited. Specifically however, the important issues for developing countries include how information technology can be used to overcome existing barriers in markets such as high transaction costs, inefficiencies in production, distribution and supply, while adding value to existing products and services and also creating new ones. Economists have noted that the failure of credit markets has been a major reason for underdevelopment.¹⁹⁵ The prospects for secure electronic funds transfer may open up opportunities for financing entrepreneurial activity, which is important to stimulate local investment in information products. Investment in physical capital is critical to facilitate the use of new technologies in the production process. Investment in software is also particularly important. In OECD countries, software investments in 2000 accounted for over 50% of the investment in information technology.¹⁹⁶ For local productivity to benefit from information technology, then, access to equity will be a vital component. Such access may be enhanced and facilitated by financial agreements through business to business (B2B) collaborations¹⁹⁷ or other forms of financing by financial services available through the Internet.

Another key factor for growth is the quality of local labour. In this regard, the vast amount of educational resources available on the Internet is a critical resource

for developing countries, as well as by linkages to institutions in developed countries.¹⁹⁸ This extends beyond prospects for formal education. Specialized learning and ongoing informal education can take place through chat-rooms, listservs and other interactive forums enabled by the Internet. While the Internet cannot and should not replace structured educational systems, it is important to point out that the Internet has made it possible to access recent and up to date information about any number of subjects, and to improve the quality of materials currently available in developing and least developed countries. These uses can also have a hortatory effect on the quality of life in developing countries by improving the quality of general participation in civil society and ultimately, democratic governance¹⁹⁹ and delivery of government services.²⁰⁰

Information technology can be used to address infrastructural barriers that have hindered traditional supply and distribution chains in developing countries. However, this benefit only goes to products or services that have no “real time/space” component. In reality, most e-commerce transactions still require physical infrastructure such as a dependable postal service, electricity, phone lines, etc., to function effectively. Only fully digital products are significantly insulated from the need for and dependence on the infrastructural capacity. With respect to developing countries then, it is important to identify how applications of information technology might contribute to economic growth, the particular sectors that would benefit particularly from information technology, and the legal rules that are most closely related to these sectors.

5.2 Identifying sectors that would benefit from information technology

There is no cognisable limitation on how information technology might enhance existing markets for products and services. For developing countries, however, important sectors with relative importance to development and growth that would benefit specifically because of information technology have been identified and studied in a variety of contexts.²⁰¹ Specifically, music

and education have received attention as areas that could profit tremendously from the benefits of the Internet.²⁰² With regard to music particularly, the Internet provides an important tool for overcoming the historically significant problem faced by artists and producers in developing countries, namely penetrating the global market.²⁰³

Music

The viability of the Internet as a marketing and distribution channel for cultural industries in developing countries has received increased attention by commentators. Much of the attention has been directed at the music industry where developing countries have some unrealised comparative advantage.²⁰⁴ Despite the fact that the Internet and related technological developments have greatly disrupted established markets in the production, distribution and consumption of musical works, particularly in developed countries,²⁰⁵ these same technologies hold promise for facilitating the development of local artistic talent and strengthening the domestic music industry. As the industry in developed countries engages in legal strategies to maintain control over existing business patterns that have generated significant revenue,²⁰⁶ it is likely that artists in all countries will share common interests in how the Internet might alter the current industry paradigm that tilts the power balance generally in favour of producers, not creators, of music.²⁰⁷

Popular music has been described as “the most global aspect of our global village”.²⁰⁸ In 1994, as the TRIPS Agreement was being concluded, the production and sales of phonograms had a reported turnover of US\$33 billion worldwide.²⁰⁹ The international market component of the music industry accounts for over half of the income of major music companies in the developed countries.²¹⁰ Interestingly, however, the ability to recoup such significant premiums is significantly

dependent on property rights granted by copyright law and, more recently, technological restrictions that control the terms of use and access. Such rights directly affect the market for music by structuring ownership, production and distribution in a manner consistent with the enumerated rights.²¹¹ Consider for example that distinct copyright protection extends to lyrics, sound recordings, musical arrangements and original compilations.²¹² In addition, copyright protection extends to performances. Given the multiplicity of copyrightable subject matter in any single music project, the music industry operates classically through licenses and contractual agreements that assign ownership rights to the music companies whose capital investment supports production, promotion and distribution of the work.²¹³ Such licenses and assignments of copyright are necessary instruments to achieve some coordination of interests between creators of such works and those who finance the actual manufacture of the tangible embodiments (i.e., phonograms) of the creative works. The investors, in turn, by virtue of these ownership rights utilize well-established business models that typically rely on retailers to distribute the works.²¹⁴ A brief survey of copyright in the music industry will elucidate the challenges faced by artists in general, and artists from developing countries in particular, given their relative lack of expertise and negotiating power. Music producers in developing countries who attempt to negotiate on behalf of domestic artists also have similar challenges when dealing with the global industry.²¹⁵

a. International Copyright Provisions for the Music Industry

The Berne Convention for the Protection of Literary and Artistic Works (Berne Convention)²¹⁶ requires member countries to provide protection to authors of literary and artistic works.²¹⁷ The substantive protections afforded by the Berne Convention, as incorporated in the TRIPS Agreement,²¹⁸ reflect global mandatory minimum requirements for protection of musical works. Under the minimum global provisions, literary and artistic works include “dramatic or dramatico-musical works”, “choreographic works and entertainments in dumb show”, “musical works with or without words”.²¹⁹ Copyright protection also extends to translations, adaptations, arrangements of music and other alterations of the protected work.²²⁰ For countries that make the distinction, artists enjoy protection for performances, sound recordings and broadcasts under a “neighbouring

rights” system.²²¹ Otherwise, copyright protection in many countries, primarily common law jurisdictions, extends to these works as well.²²²

The combination of copyright and neighbouring rights protection yields a number of rights that are associated with music creation, use and dissemination. The fundamental right afforded by the copyright system is the exclusive right to reproduce the copyrighted work.²²³ This right is subject to a limited range of exceptions expressed more precisely in the domestic laws of member countries. The Berne Convention and the TRIPS Agreement both provide a penumbral framework to determine the legitimacy of any domestic limitations to copyright²²⁴ recognized in member countries. Other than explicitly provided in the relevant treaties, any

limitations or exceptions enacted by a member country to the enumerated rights must be consistent with TRIPS Article 13. The legal relationship between the TRIPS Agreement, the Berne Convention and the Rome Convention deserves careful examination beyond the scope of this current discussion. Suffice it to say that as a matter of international law, acceptable limitations to the minimum rights incorporated in TRIPS Article 14, must satisfy the three step test of Berne Convention Article 9(2), as supplemented by the Rome Convention, and incorporated into the TRIPS Agreement. A WTO panel has already construed the scope of Article 13 of the TRIPS Agreement in relation to Article 9(2) of the Berne Convention.²²⁵ This will be instructive for determining the legitimacy of exceptions and limitations to proprietary interests in musical works.²²⁶

Article 9 of the Berne Convention explicitly provides that a sound recording “shall be considered as a reproduction”.²²⁷ Further, under Article 11, authors of dramatic and dramatico-musical works enjoy exclusive rights in (1) the public performance of their works by any means or process; (2) any communication to the public of the performance of their works and; (3) the same rights of public performance in translations of the original works.²²⁸ Finally, the Berne Convention grants

members discretion to impose limitations on the right of authors of musical works and any accompanying words to record the work.²²⁹

With respect to neighbouring rights, the minimum requirements of the TRIPS Agreement protect performers from unauthorized fixations of their unfixed performances and the reproduction of such fixation. Performers may also prevent unauthorized broadcasting by wireless means and other communication of the public of their live performance. Producers of phonograms have the exclusive right to authorize or prohibit the direct or indirect reproduction of their phonograms, the right to prohibit or authorize commercial rental as circumscribed by domestic law,²³⁰ and broadcasting organizations (or where countries do not recognize such rights for broadcasting organizations, then the right vests in the copyright owner of the subject matter) have the right to prohibit unauthorized fixation, reproduction of fixations, rebroadcasting of broadcasts by wireless means and communication to the public of television broadcasts of the fixed work.

A visual depiction of the relevant works, rights and parties implicated in copyright regimes for music can be expressed generally as follows:

Table 6: Copyright in Musical Works: An Overview

Work	Parties	Rights
Musical work	Composer (lyrics enjoy separate copyright as a literary work)	Reproduction; distribution; derivative adaptations/arrangements; public performance, including broadcasting. Can be subject to compulsory license for reproduction and distribution of mechanical copies, including digital copies that satisfy the definition of “digital phonorecord delivery.”
Sound Recording	Typically, recording artists, musicians, sound engineers under contract with a record label.	Same copyright rights (reproduction, ²³¹ distribution, etc). No general public performance right, limited <i>digital</i> public performance right; can be subject to compulsory license.
Phonograms ²³²	Producer (person who first fixes sounds of a performance or other sounds)	Right to prohibit or authorize the direct or indirect reproduction of their phonograms; rental right.
Performers/ Broadcasting Organizations	Actors, singers, musicians, dancers, and persons who act, sing, deliver, declaim play or otherwise perform literary or artistic works.	<i>Performers</i> can prevent ²³³ unauthorized fixation of their unfixed performances; reproduction of such fixation; prevent broadcast by wireless means and communication to the public of live performances. <i>Broadcasting Organizations</i> have the right to prohibit unauthorized fixation, reproduction of fixations, rebroadcasting broadcasts by wireless means, and communication to the public of television broadcasts of such rebroadcasts.

b. The Structure of the Music Industry: Challenges for Developing Countries

The significant concentration of ownership, content and revenues in developed countries, most notably the United States, poses a challenge for the music industry in developing countries. This challenge exists on several different levels. No more than six major phonogram companies account for over 80% of worldwide sales of music.²³⁴ This concentration of firms means that in terms of investment in the music industry of developing countries, there is very little foreign direct investment flows directed at local artists. Consequently, barriers to entry for local artists into the global market are significant indeed. Language and cultural barriers, and the inexact science of aligning consumer preferences and artistic style make investment by foreign firms in the talent pool of developing countries a highly speculative venture. An estimated 80% of cultural content in both music and movies is heavily American. Although Brazilian, Indian, Latin and South American artists and products have made important inroads into the industry,²³⁵ it still remains largely homogenous in content and in ownership of the organizations that distribute such content.

The concentration of content presents another set of barriers to the extent that business models that have proved successful tend to replicate genres and styles that will appeal to the consuming public measured largely in terms consistent with markets in developed countries. Access to the global market, either by the establishment of local record companies, or through other means to reach consumers is thus a vital issue in this sector. This point is significant because “access” in this regard speaks to both the ability of local content producers to penetrate the global industry and the access of consumers to diverse cultural goods. Thus, although it is possible for developed country firms to establish a presence in developing countries, some countries (mainly other developed countries) prohibit this form of access to the main promotion and distribution tributaries of the music industry precisely in the effort to constrain the influence of American content in their domestic cultural markets. Consequently, regulations limiting foreign ownership and/or participation in multimedia ventures indirectly affect the structure of access to the global record companies. In the past, the entrenched structure of the music industry made this an unavoidable tradeoff – cultural preservation versus access to the full resources of the global industry. Today, this equation has been fundamentally affected by the Internet which permits cultural products to

circulate within a digital market place without compromising the physical domestic market.

It is important to note, however, that even without these regulatory concerns, there is yet another dimension to the access conundrum facing artists in developing countries. In addition to the opportunity to have creative content exposed in the global market, access also implies the ability to control rates of return to the artist through royalty payments. In developed countries, returns are coordinated largely through a complex scheme of collective organizations, compulsory licenses and other blanket licensing schemes. Associations representing artists and performers have formed to collecting societies license works to the public on a per use basis and statutory schemes impose compulsory licenses for use under certain conditions. These mechanisms primarily relate to copyright administration. The collecting societies are represented globally, although the Internet also poses important challenges to the way these societies have hitherto operated. Importantly, despite some initial investigation and several proposals, use of collecting societies in most developing countries is still very weak or nonexistent.²³⁶ Those societies that do exist typically operate on behalf of foreign affiliates attempting to collect revenue from users, not as vehicles to help promote and license the work of local artists.

However, the layout of copyright interests in the music industry is permeated with rights associated with collecting societies and licensing agencies.²³⁷ The multiple rights involved in exploiting and distributing multimedia entertainment necessitates a coordination mechanism to reduce transaction costs and implement effective revenue collection and disbursements to artists. Generally, however, the rights vest initially in the author of the work, or in the case of a work made for hire, in the employer or entity that commissioned the work. In the music industry, however, the author’s rights are more symbolic since most rights are assigned both to facilitate investment by a record label as well as to coordinate licensing and collecting functions of copyright administration bodies. It is generally expected that the Internet will ease the transaction costs associated with collection and licensing works.²³⁸ At the very least, the fact that the Internet offers an opportunity to explore options beyond the current state of art in copyright administration, as well as in music production and distribution, will have an effect on how

new entrants penetrate the market, how revenues are generated, ownership rights are negotiated and royalties distributed. Thus far, despite the disintermediation afforded by the Internet, the music industry has, at least until very recently, continued to utilize this old

business model. In the information age, record companies seek to utilize technological developments to further consolidate ownership interests associated with the control, distribution and delivery of musical content.²³⁹

c. Internet Enabled Opportunities: Some Proposals

With regard to promotion of local artists and penetration in global markets, the Internet offers some interesting models for cultural industries in developing countries.²⁴⁰ While much work still needs to be done in this regard, some immediate prospects of the Internet for overcoming access barriers can be briefly identified. Despite the low Internet penetration rate in most developing countries, it is possible that all developing countries can exploit the Internet in modest ways to enhance the local music industry. Taken together, these three strategies may be described as an evolutionary adaptation of the Internet to facilitate the development of the domestic cultural industry.

The first strategy is a marketing model. A marketing strategy would retain aspects of the real space music market; the utility of the Internet would be primarily as an advertising forum, utilizing chatrooms, listservs or other Internet communities that already exist in cyberspace. Such marketing might be enhanced by making digital samples available online if the country has the technological capacity for conveying digital files. This model does not require a high Internet penetration rate and thus could be used by countries where telecommunications infrastructure is particularly insufficient or significantly underdeveloped.

A second strategy is a distribution model. Multimedia products such as audiovisual and musical works are supremely suitable for distribution through digital networks. Indeed, this has become the bane of the cultural industry in the United States which has vigorously resisted the use of peer to peer systems and the ubiquitous culture of file sharing on the Internet. Yet, these technologies that threaten the orthodox models of the music industry offer the very real prospect of overcoming barriers to entry for artists and performers in developing countries specifically by facilitating artist-to-consumer transactions and relationships.

A third strategy combines the first two models and adds a payment feature. Given the fairly established patterns

of payment on the Internet, local artists may advertise their product, distribute samples and ultimately send the entire product via the network in exchange for payment. A payment system utilizing local banks, wire-transfers, or other electronically processed payment scheme such as those already in use through e-commerce may be employed for these purposes. There are several creative ways to arrange for payment ranging from purely electronic schemes through credit card payments to payments through local banks, wire transfers and Internet based programs. In essence, this model would overlap with existing mechanisms for international capital transfers that are already well established.

The benefits of this evolutionary adaptation flow from its malleability and sensitivity to various developmental stages and the corresponding levels of access to the Internet, as well as the nature of Internet infrastructure, which necessarily affects how the products might be exploited. Thus, the utility of the Internet in this industry to overcome traditional barriers facing local artists will require a coordinated framework consisting of the physical infrastructure (computers, Internet access) the software (digitisation, encryption and encoding to prevent unauthorized resales or distribution) and the legal regime of copyrights that grants the local artists the exclusive rights to their products. It is interesting that the lack of adequate access to physical infrastructure will necessarily require a greater dependence on copyright rights so that local creators can control and manage their right to returns as their works enter the global market through the agency of the Internet. This dependence on copyright as a means to stimulate the local industry will be in some tension with the interests of developing countries to maintain an environment where access to content on the Internet is sustainable.

Finally, creative analysis of how copyrights / neighbouring rights should be structured in developing and least developing countries is particularly important from the global context. The TRIPS Agreement establishes a minimum framework of rules that all member states

must recognize. However, interpretation of TRIPS obligations requires an examination of the Rome Convention and other international agreements such as the WPPT, and how these agreements are to be reconciled. Minimal global obligations will depend in part on the particular combination of agreements in effect in a particular jurisdiction. Developing and least developed countries should use the current state of flux in the organization of the global music industry to determine how best to implement the minimum rights articulated in the TRIPS Agreement. Emphasis should be

on the nature of rights and institutions necessary to encourage growth of the domestic industry through revenue generation and collection, as well as through the production and distribution of products on a global scale. Rather than mimic the established copyright institutions that have both facilitated the exploitation of works, but that has also proven less satisfactory to creators, developing countries should consider alternatives that provide opportunities for domestic talent by utilizing the versatility of information technology.²⁴¹

Education

One of the most important development objectives implicated by intellectual property rights is access to education. In preparations leading up to the World Summit on the Information Society, (hereinafter World Summit) education has been listed repeatedly as an important development goal, one for which the Internet offers a uniquely important prospect of success.²⁴² At a general level, social education is made possible simply by the virtue of the vast amounts of information available on the Internet. Individual citizens can search, research and gather information freely over the Internet about an infinite amount of subjects and issues. Online communities and the practice of “linking” make topical navigation of the Internet the most common facilitative interaction of the information age. The significant intellectual commons available on the Internet is breathtaking, giving rise to important needs to organize and systematize such information. There are also the unavoidable issues about the legitimacy and accuracy of information available on the Internet. Yet, even in this respect, there are various “clearinghouses” and business models using search engines that have emerged to provide some organizational structure to Internet content.

In addition to social education, formal education is also a highly valued feature of Internet viability for development goals. Several academic institutions in developed countries have already forged alliances with educational institutions in developing countries to provide educational course materials, to share ideas and research and to engage in distance education. The OpenCourseWare (OCW) initiative launched by the Massachusetts Institute of Technology (MIT) provides a leading example of how the Internet can serve this important development goal.²⁴³ The OCW is explicitly premised on the ideal of communal sharing of

intellectual works by “providing a new model for the dissemination of knowledge and collaboration among scholars around the world, and to contribute to the shared intellectual commons in academia...”²⁴⁴ In this innovative approach to education in an online environment, OCW offers free and open access to course materials created by instructors at MIT. The course resources are voluntarily submitted by instructors. While the OCW is not a distance education program in the sense that access and use of the materials is not a means to earn a degree or certification, it nonetheless has a powerful appeal for developing countries whose institutions lack the economic resources to educate students and to promote scholarship by instructors. In other words, while sharing course materials has been a contentious issue in the United States for a variety of reasons, such an open approach to educational content is precisely what is most direly needed in developing countries. Indeed, course sharing projects are a vital part of maintaining a real academic commons on the Internet while at the same time building a global knowledge value chain that can benefit developing countries.

Despite the promise of projects such as OCW,²⁴⁵ copyright interests may still pose barriers for countries seeking to utilize educational materials. First, the WCT obligations provide protection for owners of educational materials who protect their content by technological devices. Thus, circumventing these devices will be suspect under this international agreement. Further, utilizing the Internet to communicate creative content violates multiple copyright rights afforded by the Berne Convention and affirmed by the WIPO Internet treaties, or through bilateral agreements. Substantive access to educational content is also vulnerable to control by owners. For example, in regions where the language of

the content is different from the major language, there will be a need to translate the materials. By virtue of copyright, however, translation rights belong exclusively to the copyright owner. Consequently, potential users may still need to obtain permission to translate the works before access to content can be accomplished.²⁴⁶

There is also further concern about the diversity of cultural content in course sharing projects. In a truly open collaborative project, the commons is enriched by both access and deposit. In other words, ideas and expressions from developing countries should also be encouraged and efforts should be made to promote an educational commons that benefits from creativity in different cultural contexts. In this regard, the OCW license permits modifications and adaptations so long as the derivative work is also licensed freely and openly on the same terms as OCW works. In this and many other respects, OCW is modelled along lines similar to the Open Source movement in software.

The appeal of an open courseware model is particularly significant given the failure of the compulsory licensing provisions of the Berne Convention in promoting access to educational works for developing countries. The Berne Convention Appendix, which governs compulsory

licenses, has been under-utilised for reasons ranging from the complexity of the terms of the Appendix, to the administrative costs associated with using the Appendix.²⁴⁷ Further, the legal status of the Appendix in a post-TRIPS environment is currently unclear.²⁴⁸ In any event, with relatively few exceptions, free and open access is still preferable and more accessible than works made available under a compulsory licensing regime. It is implausible that the Appendix could be extended to the Internet in any meaningful way. Interpretations of TRIPS provisions that might suggest the Appendix as a reasonable framework to deal with access to digital content for educational purposes should be viewed with considerable caution by developing countries. Despite the incorporation of the Appendix in the TRIPS Agreement,²⁴⁹ it seems clear that the Appendix was not negotiated with the information age in mind. The WIPO Internet Treaties presumably are the appropriate texts for considering digital course materials. However, these treaties do not contain similar provisions dealing specifically with the development interests of countries in accessing literary materials for educational instruction. Consequently, attempts by developing countries to create special access regimes²⁵⁰ for educational purposes are reasonably within the purview of legitimate exercises of sovereign discretion.

6. SOME EMERGING CONSIDERATIONS

6.1 The Information Technology and Intellectual Property Interface

Despite indications of commitment from developed countries to support the integration of information technologies into development programs, most of the activities undertaken in light of these commitments have failed to examine the important relationship between the regulation of information technology and global rules for intellectual property protection. As some scholars have argued, the information economy may require different rules with respect to the protection of content or even hardware, than the traditional economy. The contested boundaries between trademarks for domain names, business method patents for Internet businesses, and copyright protection for content all threaten precipitously to recreate high margins of difference between developed and developing countries. The irrepressible move to create a global property rights system in data and databases, both of which are the primary constitutive elements of the Internet and associated applications,²⁵¹ together with the existing multilateral agreements create an unhealthy environment for development. In this “back to the future” paradigm, developing countries will be bound by international agreements that constrain their efforts to access the building blocks of economic growth which consist of access to content and competitive opportunities to create new markets and new products. It is important to note that this problem is not limited

to developing countries; there continue to be conflicts and heated negotiations between stakeholders in developed countries about the nature and extent of rules designed for social and economic use of the information.

Of immediate strategic importance is the need for developing and least developed countries to reconcile their identifiable ICT priorities with their participation in intellectual property agreements. Inadequate appreciation of the relationship between development goals that require access to the tools of the information age, and global agreements regarding intellectual property rights, can potentially limit the policy space within which countries can pursue their development agendas. Specifically, it is important for developing countries to consider the impact of accession to the WIPO Internet treaties on their development goals. For those countries that have ratified the treaties, careful consideration should be given to best options for integrating the obligations of the treaties into domestic law. The point is not that copyright rules are detrimental to development efforts, but instead that the unbridled extension of these rules to the Internet environment, without corresponding limitations to facilitate legitimate public policy objectives will unnecessarily handicap identified development strategies.

6.2 Open Source versus Proprietary Software

Domestically, and perhaps even regionally, developing countries have to consider how best to promote innovation, competition, and use of information technology. An important issue, increasingly global in nature, is the choice between proprietary or open source software development methods.²⁵² The open source movement has its roots in the early era of the Internet when significant aspects of computer operating systems were developed in academic communities.²⁵³ By one estimate in 2002, the open source program Linux has anywhere between seven and twenty one million users worldwide and an expected growth rate of 200%.²⁵⁴ There have been significant capital investments in open source projects from established firms including IBM and Sun Microsystems, and a significant investment in

commercialising Linux.²⁵⁵ Beneficiaries of the open source movement include software developers whose collaborations build add value to the chain of software supply, developing countries whose benefit from access to free software and major corporations.²⁵⁶

The Open Source movement is a model of software development that utilizes volunteer collaborative communities of programmers. In an Open Source project, the source code of the software program is available to other programmers to use, study, adapt or distribute under liberal licensing terms. These terms reflect a tradition of open standards, sharing and collaboration to create, improve, modify and distribute software.²⁵⁷ The most well known expression of the open source culture

is the GNU General Public License (GNU GPL), which is behind the GNU/Linux operating system. This is also often referred to as the “copyleft” license because rather than use the copyright interest in source code to restrict what others can do with and to the software, the GNU GPL uses such ownership in conjunction with contract law, to enforce a norm of open access to computer programs.²⁵⁸ The first software programmers writing computer code for the Linux system distributed their copyrighted works pursuant to the GNU GPL which authorizes others to use, modify and redistribute the programs, as well as to create and distribute new programs that are based on the original ones. Under copyright law, such modifications would be considered derivative works and would normally be a violation of the first author’s rights. The GNU GPL authorizes the creation of such derivative works, however, only so long as the same culture of openness is adhered to by subsequent developers. Thus, contrary to popular perception, the open-source movement relies significantly on the proprietary principles of copyright; the important distinction is that open-source projects utilize copyright as a means to ensure and promote access to creative works.

Several important development benefits have been attributed to open source. First, Open Source supplies developing countries with access to the dominant UNIX/X Windows computing environment with *de minimis* software costs.²⁵⁹ The benefits of low cost are compounded by the fact that Linux runs on IBM compatible hardware which is generally more accessible

in developing countries than other PC’s. Further, complementary tools for Linux applications are also more freely available to software developers. Evidence from developing countries such as India and Pakistan suggests that the large variety of tools freely available has added value to the educational endeavour of teaching courses in computer science and electrical engineering.²⁶⁰ Open Source thus has an indispensable and powerful development strategy namely, the growth of a domestic cadre of computer software engineers and developers who are skilled and equipped to participate in the global software commons. Open Source adoption by developing countries has been encouraged by international organizations, scholars and civil society groups.²⁶¹ Most recently, several developed and developing countries have announced their intention to encourage or develop their own open source programs.²⁶² Recently, individual states in the United States have followed suit.²⁶³

The Open Source model is not, however, without challenges. Quality control of the software is difficult to monitor given the number of software developers involved in a project. Further, it is difficult to guarantee that proprietary code has not been utilized by a participant in the project thus violating a third party’s proprietary rights. Recent litigation in the United States suggests that the Open Source movement is vulnerable to such legal attacks.²⁶⁴ Nonetheless, it seems unquestionable that the open-source model has important development benefits and its value should be considered as a viable platform for developing countries.

6.3 Appropriating the Benefits of the Information Age

The Internet offers a dynamic set of technological tools, and is the subject of experimental regulatory frameworks and legal rules. It is unlikely that anything firm or consistently predictable will emerge any time soon to govern this digital space. For developing countries this presents both opportunities and challenges. Appropriating the benefits of the information age is directly related to how investments in information technology are influenced and supported by regulatory frameworks that promote innovation, access and use. In addition to capital investments in information technology, developing countries should undertake to invest in the necessary macroeconomic policies that will facilitate an environment where the domestic population is able to adapt to the existence of the Internet, and to

encourage entrepreneurial uses of the different opportunities that information technology can offer to deal with existing distribution, dissemination and communication problems that bedevil developing country markets. Developing countries can do so currently by utilizing existing capacities and developing the infrastructure necessary to maintain substantial and viable connections to the Internet. On the other hand, there are also risks associated with a static approach. In most other areas of technological development, developing countries have been left behind both in terms of capacity and infrastructure, but also in terms of their participation in the formulation and negotiation of legal rules that are then implemented globally or that have global effect. It is important that developing countries strike a

balance between free-riding on existing spillover effects of the Internet and participation in global negotiations where rules are being developed that will shape the

future of the Internet and hence, the terms on which all countries will participate in an increasingly and irrevocably networked global environment.

7. CONCLUSION

Information asymmetries introduced or supported by legal rules such as intellectual property rights, or regulatory policies affecting competition in the provision of telecommunications services, can skew the competitive advantages that information technologies offer for developing countries. The following points summarize important factors that policy makers should keep in mind in formulating information policies with a development focus.

(a) Despite the emphasis on the need for a strong telecommunications infrastructure for greater physical access to the Internet, the development of third generation Internet technologies through satellite suggests that in a short period of time even this major problem may not be as significant a barrier for access to the Internet. An important task, then, is to develop guidelines concerning how much developing country resources should be invested in adapting to the current Internet state of art given the dynamic rate of innovation in communications technology. These are questions that require careful and sustained empirical analysis to ensure that developing countries the digital divide does not remain a permanent feature of the information age.

(b) Exploiting the potential of the Internet to facilitate development objectives requires access to hardware (computers), software and content. Innovation, competition and deregulation in the telecommunications industry will enhance the opportunities for access to hardware by citizens. Intellectual property agreements have important implications for access to software and digital content. In the context of software, developing countries need to explore alternatives to proprietary regimes, the most important being the Open Source model which has proven to be a dynamic and, in some instances, more effective model of software development. For developing countries and LDCs, the Open Source model is not just beneficial for improving access to software, but also for the opportunities it offers to facilitate the training of domestic software engineers, and the relatively low cost of complementary technologies.

(c) Business method patents can have inhibiting effects on competition in new markets and the opportunities made possible by information technologies. Most economic analyses of business method patents suggest that such patents have an inimical effect on competition and organizational innovation. Developing countries

should preserve domestic policy space to make decisions that are consistent with development priorities by adopting, as India has done, a *per se* rule against the patentability of business methods.

(d) International copyright agreements have a significant and unavoidable impact on access to creative works in the digital age. The two WIPO Internet treaties have been implemented in a few developed countries in a manner that is highly restrictive and that imposes undue social costs on consumers. Developing countries should be aware that these two treaties affect access by wire and wireless means, and domestic limitations or exceptions to the rights granted by the treaties are likely to be influenced by interpretations of the TRIPS Agreement. Developing countries must insist on the possibility of enacting domestic limitations, including the application of compulsory licenses, to digital works.

(e) The Appendix to the Berne Convention is currently the most prominent access model to literary works in international copyright law. However, developing countries have not successfully utilized the provisions of the Appendix with regard to facilitating access to protected works through compulsory licenses. Consequently, an alternative model must be considered. Developing countries and LDCs should consider, for example, adopting ad hoc provisions to deal with copyright in digital works, rather than adopting wholesale treaty provisions that may deprive them of policy options more conducive to national priorities. What is ultimately important is that, in the context of multilateral or bilateral negotiations, developing countries must appreciate the importance of copyright to the ability to access and realize the benefits of information technology and information goods. Robust access principles in the international agreements, or the freedom to impose such access mechanisms domestically, must be preserved for development purposes.

(f) Institutions of higher learning are an important aspect of developing a strong technology base in any society. The possibility of distance education learning should occupy a central place in development strategies for the information age. This will require implementation of copyright treaties in a way that ensures that proprietary rights are balanced with public policy limitations that permit use and access for educational purposes, distinct from other socially beneficial uses.

Finally, there has been caution expressed by some scholars and commentators about the unbridled optimism and expectation of what information technology can accomplish for developing countries. It is certainly the case that technology does not represent the exclusive or even primary solution to the multifaceted challenges of underdevelopment. However, the ubiquitousness of

information technologies provides a universal context to examine the backward looking question of how to rethink approaches to existing impediments to economic growth, and the forward looking question of how new technology can be deployed to generate new revenue streams and stimulate entrepreneurial activity in developing countries.

END NOTES

¹ See TRIPS Art. 3 (requires Contracting Parties to apply Art. 2-6 of the Berne Convention). Note that the TRIPS Agreement requires Members to comply with Articles 1-21 of the Berne Convention, including the Berne Convention Appendix.

² See Art. 4.

³ See Art. 5.

⁴ See Articles 6, 7 and 8. The TRIPS Agreement makes explicit reference only rental rights (see Art. 11). WCT Art. 7 parallels this TRIPS provision, except with regard to rental of phonograms. Under the WCT, the right belongs to the author of the work embodied in a phonogram. Under the TRIPS Agreement, the right is ascribed to “producers” of phonograms, and other right holders in phonograms as determined by domestic laws of member countries. See TRIPS Art. 14 (4).

⁵ See Art. 12 (2).

⁶ See WPPT, Art. 5-10.

⁷ See WPPT, Art. 11-14.

⁸ See WPPT Art. 15(1).

⁹ See WPPT, Art. 18-19.

TIMES, Feb. 28, 2003, at A14 (noting privacy objections to U.S. policies); Adam Clymer, *Threats and Responses: Electronic Surveillance; Congress Agrees to Bar Pentagon From Terror Watch of Americans*, N.Y. TIMES, Feb 12, 2003, at A1; Adam Clymer, *Threats and Responses: Surveillance; Pentagon Forms 2 Panels To Allay Fears on Spying*, N.Y. TIMES, Feb. 8, 2003, at A10 (noting public and political opposition to privacy threats).

²⁸ The OECD has stated that successful development of e-commerce depends "to a large extent on transborder solutions based on policy co-ordination between countries and between stakeholder constituencies." See http://www.oecd.org/about/0,2337,en_2649_37441_1921035_1_1_1_37441,00.html. There is a consensus shared by policy makers and scholars that the inherently global nature of the infrastructure requires a multilateral approach to the complex issues affecting e-commerce regulation. There has also been an emphasis that e-commerce regulation is squarely within the domain of the WTO. See Catherine L. Mann and Sarah Cleeland Knight, *Electronic Commerce in the WTO*, in *THE WTO AFTER SEATTLE* 253 (Ed. Jeffrey J. Schott 2000); Catherine L.Mann, Sue E. Eckert, and Sarah Cleeland Knight, *Global Electronic Commerce: A Policy Primer* (2000).

²⁹ See generally, F. Frobel, J.Heinrichs and O. Kreye, *The New International Division of Labor* (1981). Some scholars and commentators argue that the influential forces of Internet regulation are similar to those that shaped the industrial era. Consequently, the infrastructure of the Internet will reinforce and strengthen existing transnational patterns of production, ownership and capital distribution. See e.g., Dan Schiller, *Digital Capitalism: Networking the Global Market System* (1999).

³⁰ There is a significant amount of economic literature on the causes of economic growth. The pioneering work on growth theory is Robert M. Solow, *A Contribution to the Theory of Economic Growth*, 70 QUARTERLY JOURNAL OF ECONOMICS 65 (1956) (emphasizing technological progress as the source of economic growth). Endogenous growth theorists emphasize human and physical capital as the primary engine of economic growth. For important works on endogenous growth theory, see e.g., Paul M. Romer, *Increasing Returns and Longrun Growth*, 94 JOURNAL OF POLITICAL ECONOMY 1002 (1987); Robert E. Lucas, *On the Mechanics of Economic Development*, 22 JOURNAL OF MONETARY ECONOMICS 3 (1988). Robust evaluations of prospects for development in the information age require analyses of these contributions from major schools of economic growth theory.

³¹ See, e.g., 2001 OECD Ministerial Report, *The New Economy: Beyond the Hype*, The OECD Growth Project (2001) [hereinafter, *The New Economy*]; *A New Economy?:The Changing Role of Innovation and Information Technology in Growth*, OECD (2003); *ICT and Economic Growth: Evidence from OECD Countries, Industries and Firms*, OECD (2003).

³² See, e.g., OECD Guidelines for Protecting Consumers from Fraudulent and Deceptive Commercial Practices Across Borders (2003); OECD Guidelines for the Security of Information Systems and Networks: Towards a Culture of Security (2002).

³³ See *supra*, note 31. See also, *The New "New Economy,"* THE ECONOMIST, September 13, 2003.

³⁴ See, e.g., the recent report of the United States Federal Trade Commission, *To Promote Innovation: The Proper Balance of Competition and Patent Law and Policy, Executive Summary*, available at <http://www.ftc.gov/os/2003/10/innovationrptsummary.pdf>. See also, Letter from the Balanced Copyright Coalition to the Standing Committee on Canadian Heritage (urging Canada to adopt balanced copyright norms and to avoid the U.S. approach) Sept. 15, 2003 (copy on file with author).

³⁵ As many scholars have noted, a regulatory approach to technological innovation that encourages balance between the interests of primary and secondary innovators, and between owners and users, is also important for developed countries. See e.g., Jane C. Ginsburg, *Copyright and Control over New Technologies of Dissemination*, 101 COLUM. L. REV. 1613, 1635-36 (2001) (noting need to balance incentives for innovation against competing social interests when enforcing the DMCA); Jason Sheets, *Copyright Misused: The Impact of the DMCA Anti-Circumvention Measures on Fair*

& *Innovative Markets*, 23 HASTINGS COMM/ENT L.J. 1, 4 (2000) (noting the importance of balance and the DMCA's threat to that balance).

³⁶ There is widespread consensus on this point. For a general discussion, see Patrizia Fariselli, *E-Commerce for Development: A General Framework*, in Andrea Goldstein and David O'Conner, *Electronic Commerce for Development*, 36-39, OECD (2002).

³⁷ See, e.g., Allen S. Hammond, *The Telecommunications Act of 1996: Codifying the Digital divide*, 50 FED. COMM. L.J. 179, 196 (1997) (noting that the high price of computers prevents low-income households from owning them).

³⁸ National Telecomms. & Info. Admin., U.S. Department of Commerce, *Falling through the Net II: New Data on the Digital Divide* (1998), available at <http://www.ntia.doc.gov/ntiahome/net2/falling.html> (reporting significantly lower rates of access in rural communities); Pippa Norris, *Digital Divide* 10-12, 68-92 (2001) (showing significantly lower rates of access for members of racial and ethnic minorities, and those with low incomes); Amanda Lenhart, Pew Internet & American Life Project, *Who's Not Online: 57% of Those Without Internet Access Say They Do Not Plan to Log On* (2001), at <http://www.pewinternet.org/reports/toc.asp?Report=21> (reporting lower rates of access for women).

³⁹ Named after the founder of Intel Corporation, Moore's law states that the number of transistors on a chip doubles every 18 to 24 months. This would result in an expected \$10 billion cost reduction in the first half-century of the computer age. The result is simply that costs to consumers are very low and will continue to decrease. Gordon Moore, *Cramming More Components On to Integrated Circuits*, ELECTRONICS, Apr. 19, 1965, at 114.

⁴⁰ See David O'Conner, *E-Commerce for Development: Between Scylla and Charybdis*, in Andrea Goldstein and David O'Conner, *Electronic Commerce for Development* 55, 55-56 (2002) (noting the declining costs of telecommunications and internet costs and suggesting that under these conditions, "prospects have never been so good for poor countries to acquire advanced technologies relatively early in their diffusion phase. Rather than widening the technology gap, rapid technological innovation at the frontier can actually hasten diffusion by inexorably driving down costs of computer power and communications"). *Id.* at 56. Nonetheless, a divide is persistent between racial and gender lines, as well as between urban and rural areas in all countries. See Joel Rothstein Wolfson, *Social And Ethical Issues in Nanotechnology: Lessons From Biotechnology And Other High Technologies*, 22 BIOTECHNOLOGY L. REP. 376, 379 n. 8 (2003) ("For example, our most recent [U.S.] data show that divides still exist between those with different levels of income and education, different racial and ethnic groups, old and young, single and dual-parent families, and those with and without disabilities.") Other countries mirror the U.S. divide. See Susanna Frederick Fischer, *The Global Digital Divide: Focusing on Children*, 24 HASTINGS COMM. & ENT L.J. 477, 484-90 (2002) (discussing the United Kingdom, France, and Australia).

⁴¹ O'Conner, *id.*

⁴² See Appendices A, B, C and D.

⁴³ For example, Internet Cafes have become very popular avenues of Internet access in many developing countries despite problems with telecommunications infrastructure. Other important sources of access are institutions of higher education.

⁴⁴ See, e.g., Martin Cave and Robin Mason, *The Economics of the Internet: Infrastructure and Regulation*, 17 OXFORD REVIEW OF ECONOMIC POLICY, 188 (2001).

⁴⁶ Denise Pappalardo, *The ISP Top Dogs*, NETWORK WORLD INTERNET SERVICES NEWSLETTER, MAY 30, 2001, available at <http://www.nwfusion.com/newsletters/isp/2001/00846039.html>. Another report suggests that in the year 2000, the big six providers (America Online, NetZero, EarthLink, CompuServe, MSN Internet Access and AT&T World Net, accounted for over 73% of the market. See, *Report Shows Internet Approaching Oligopoly*, available at http://www.isp-planet.com/research/census_q12k.html.

⁴⁷ Pappalardo, *id.*

⁴⁸ Consider for example, the MCI and WorldCom merger in 1998 or the Time-Warner/AOL merger in January 2000. The Federal Trade Commission noted possible anti-competitive effects of the MCI/Worldcom merger in *In re Application of WorldCom, Inc. and MCI Communications Corporation for Transfer of Control of MCI Communications to WorldCom, Inc.*, Memorandum Opinion and Order, 13 FCC Record 18025, 18103-18115, paras. 149-150 (1998). Commentators raised similar concerns about the AOL/Time Warner merger. See also, Sarah G. Lopez, Note, *Evaluation of the AOL Time Warner Consent Decree's Ability to Prevent Antitrust Harm in the Cable Broadband Isp Market*, 17 ST. JOHN'S J. LEGAL COMMENT. 127, 147-149 (2003) (noting possible anti-competitive harms).

⁴⁹ For analyses of issues relating to the market structure for the Internet, see, e.g., R.A. Mason, *Simple Competitive Internet Pricing*, 44 *EUROPEAN ECONOMIC REVIEW*, 1045 (2000); P. Rey and J. Tirole, *Connectivity in the Commercial Internet*, 48 *JOURNAL OF INDUSTRIAL ECONOMICS*, 433 (2000). See also, Cave and Mason, *supra* note 44.

⁵⁰ James Boyle has adroitly termed this “the second enclosure.” See James Boyle, *The Second Enclosure Movement and the Construction of the Public Domain*, 66 *LAW AND CONTEMPORARY PROBLEMS*, 33 (2003).

⁵¹ Digital Millennium Copyright Act of 1998 (DMCA), 17 U.S.C. §§ 1201-1203 (2000).

⁵² See, e.g., J.H. Reichman and Paul F. Uhlir, *A Contractually Reconstructed Research Commons for Scientific Data in a Highly Protectionist Intellectual Property Environment*, 66 *LAW AND CONTEMPORARY PROBLEMS* 315 (2003); Charlotte Hess and Elinor Ostrom, *Ideas, Artifacts, and Facilities: Information as a Common Pool Resource*, 66 *LAW AND CONTEMPORARY PROBLEMS* 111 (2003).

⁵³ See e.g., Robert J. Gordon, *Does the “New Economy” Measure up to the Great Inventions of the Past?* *J. OF ECON. PERSP.* 49 (2002); J. Bradford Long, *What ‘New’ Economy?* *THE WILSON QUARTERLY*, 14 (Autumn 1998). But see Robert J. Gordon, *Five Puzzles in the Behavior of Productivity, Investment, and Innovation*, available at <http://faculty-web.at.northwestern.edu/economics/gordon/researchhome.html> (modifying his earlier conclusions).

⁵⁴ See generally, Symposium on E-Commerce, *Journal of Economic Perspectives*, (2002). See also, Brie-IGCC, *Tracking a Transformation: E-Commerce and the Terms of Competition in Industries* (Brookings, 2001).

⁵⁵ See generally, E. Brynjolfsson and B. Kahin, (eds.) *Understanding the Digital Economy* (1999).

⁵⁸ Severin Borenstein and Garth Saloner, *Economics and Electronic Commerce*, *J. OF ECON. PERSP.*, 3 (Winter 2001); Erik Brynjolfsson & Lorin M.Hitt, *Beyond Computation: Information Technology, Organizational Transformation and Business Performance*, *J. OF ECON. PERSP.*, 23 (Fall 2000).

⁵⁹ This chart, with slight changes, is from Sagren Moodley, *The Prospects and Challenges of E-Business for the South African Automotive Components Sector: Preliminary Findings from Two Benchmarking Clubs*, in Andrea Goldstein and David O’Conner, *Electronic Commerce for Development 75*, OECD (2002).

⁶⁰ Borenstein and Saloner, *supra*, note 58, at 3-4.

⁶¹ *Id.* at 4-9 (summarizing how the Internet creates supply and demand side value).

⁶² Sagren Moodley, *The Prospects and Challenges of E-Business for the South African Automotive Components Sector: Preliminary Findings from Two Benchmarking Clubs*, in Andrea Goldstein and David O’Conner, *Electronic Commerce for Development 75*, OECD (2002).

⁶³ See generally, Michael D. Smith, Joseph Bailey, Erik Brynjolfsson, *Understanding Digital Markets: Review and Assessment*, in Erik Brynjolfsson and Brian Kahin, *Understanding the Digital Economy* (2000).

⁶⁴ How significant these returns might be appears to depend at least partially on the product in question. A recent study found that in nine least developed countries with some e-commerce activity, sales were slow. The author attributes this partly to the fact that products being sold were those more likely to be at the bottom of the value curve. See William Wresch, *Initial e-commerce Efforts in Nine Least Developed Countries: A Review of National Infrastructure, Business Approaches and Product Selection*, 11 *JOURNAL OF GLOBAL INFORMATION MANAGEMENT*, 67 (April-June 2003).

⁶⁵ See Wresch, *id.*, (describing websites in Ghana, Kenya, Mozambique, Nepal, Nicaragua, Pakistan, Senegal, Sudan and Tanzania and finding a significant use of hosting services in other countries, particularly the United States).

⁶⁶ *The Networking Revolution: Opportunities and Challenges for Developing Countries*, InfoDev Working Paper, World Bank (2000) available at <http://www.infodev.org/library/working.htm>. See also, Duncan Campbell, *Can the Digital Divide Be Contained*, 140 *INT. LABOUR REV.* 119 (2001).

⁶⁷ Andrea Goldstein, *Local Entrepreneurship in the Era of E-business: Early Evidence from the Indian Automobile Industry*, in Andrea Goldstein and David O’Conner, *Electronic Commerce for Development 93*, 109 OECD (2002) (providing a case study of Fiat India).

⁶⁸ There is an emerging body of literature on sector-specific benefits of the Internet in developing countries. For some case studies, see Andrea Goldstein and David O’Conner, *Electronic Commerce for Development*, OECD (2002). Similar work is also being done for developed countries. See e.g., Brie-IGCC, *Tracking a Transformation: E-*

Commerce and the Terms of Competition in Industries (2001). Most of the existing reports, however, ignore the role and impact of the multilateral framework for intellectual property on these countries.

⁶⁹ See *The New Economy*, *supra* note 31, at 20-21. See also, *Measuring the Information Economy*, 9-11, OECD (2002).

⁷⁰ <http://www.census.gov/estats>.

⁷¹ Nua Internet Surveys, *eMarketer: Worldwide B2B revenues to pass one trillion*, Apr. 1, 2003, at http://www.nua.com/surveys/index.cgi?f=VS&art_id=905358753&rel=true.

⁷² See *E-Commerce in Europe: Results of the pilot surveys carried out in 2001*, Eurostat (2001).

⁷³ *Business News Americas*, Oct. 29, 2002. It is important to note, however, that while there is a reported 30% rise in Brazilian companies online in 2002, only ten companies are said to be responsible for the 80% increase in the e-commerce figures for 2002. B2B transactions account for the vast majority of Brazil's e-commerce activity, representing \$5.3 billion in 2001, a figure that eMarketer predicts will jump to \$34.7 billion by 2004. Forrester predicts even stronger growth, projecting B2B revenues to reach \$59.4 billion by 2004. [Emphasis added]. See, Narry Singh, *Brazil: Untapped Potential*, IQ MAGAZINE, Sept./Oct. 2002, http://business.cisco.com/prod/tree.taf%3Fasset_id=88035&ID=85948&public_view=true&kbns=1.html

An analyst with the same group (Forrester Research) predicts Brazil's 2004 figure:

"E-commerce in Latin America will thrive in the coming years thanks to a rollback of protectionist policies, innovative uses of mobile technology, and pressure from Internet-sophisticated global trading partners," said Matthew Sanders, associate analyst. "Brazil will lead this region by trading \$64 billion online by 2004. MERCOSUR neighbor and principal trading partner Argentina will follow with more than \$10 billion in online sales." See Michael Pastore, *Latin American E-Commerce Showing Signs of Growth*, April 26, 2000, http://cyberatlas.internet.com/big_picture/geographics/article/0,1323,5911_348161,00.html.

⁷⁴ Some figures for Chile put the 2002 e-commerce figures at USD 3 billion. See *Business News Americas*, *B2B Transactions to Double in Chile* (Aug.22, 2002), at http://www.nua.ie/surveys/index.cgi?f=VS&art_id=905358566&rel=true.

Cudahy, *Whither Deregulation: A Look at the Portents*, 58 N.Y.U. ANN. SURV. AM. L. 155, 163-65 (2001) (describing deregulation and antitrust enforcement in U.S. telecommunications industry); Robert M. Frieden, *The Telecommunications Act of 1996: Predicting the Winners and Losers*, 20 HASTINGS COMMENT L. J. 11, 15-16 (1997) (analyzing the effect of federal law intended to increase competition in the telecommunications industry); Martin Cave and Robin Mason, *The Economics of the Internet: Infrastructure and Regulation*, 17 OXFORD REVIEW OF ECONOMIC POLICY, 191-195 (2001) (discussing competition issues related to access to the Internet).

¹¹¹ Andy Johnson-Laird, *Looking Forward, Legislating Backward?* 4 J. SMALL & EMERGING BUS. L. 95, (2000) (defining “host computer,” or “server,” as “a computer system that provides responses or services to one or more client computers”). He adds that “this definition is not exhaustive: there can be several different host computers in any given configuration, and any one of those computers can simultaneously be both a host for certain services and a client either for the same services or for other services.”

¹¹² Mowery & Simcoe, *supra*, note 100 at 1379. See also, BUSINESS WEEK ONLINE, July 13, 1999. These numbers can be somewhat misleading as a “dotcom” domain is certainly not necessarily an indicator of commercial/entrepreneurial or productive activity. Nonetheless, it is fairly well established that commercial activity constitutes a significant proportion of Internet traffic in the United States. The number of dot.com hosts rose from 332,647 in 1996 to 40,555,072 in 2003. Internet Software Consortium, *Host Distribution by Top-Level Domain Name*, July 1996, <http://www.isc.org/ds/WWW-9607/dist-byname.html> (332,647 dot.com hosts); Internet Software Consortium, *Distribution by Top-Level Domain Name by Name*, Jan. 2003, <http://www.isc.org/ds/WWW-200301/dist-byname.html>. The increase in dot.com registrations greatly exceeded increases in other domain names, such as .edu and .org. See data in Zooknic Internet Intelligence, *History of gTLD Domain Name Growth* <http://www.zooknic.com/Domains/counts.html> (last visited Oct. 22, 2003).

¹¹³ Experts and analysts believe that this situation will change. There is also general consensus that organizational changes are significant even in the use of the Internet for functions such as customer service, communication and marketing.

¹⁴⁰ U.S. Patent No. 5,794,207.

¹⁴¹ U.S. Patent No. 5,960,411.

¹⁴² WIPO is currently engaged in a project specifically directed at enhancing SME use of intellectual property rights. See <http://www.wipo.org>. Despite evidence of uncertainty about the effects of patents in general, and business method patents in particular, there is some empirical evidence to suggest that SMEs in major developed countries hold the view that formal intellectual property rights, primarily patents, are less important for their economic activities. See Puay Tang and Dan Pare, *Gathering the Foam: Are Business Method Patents a Deterrent to Software Innovation and Commercialization?*, 17 INT'L REV. OF LAW, COMPUTERS AND TECHNOLOGY 127, 146-54 (2003). See also, Esteban Burrone, *Why Intellectual Property Matters*, available at <http://www.wipo.org/sme/en/documents/pdf/ipmatters.pdf>, at p. 2 (noting several studies concluding that SMEs place less emphasis on patent protection). Nevertheless, the author offers several strategies to enhance the value of intellectual property rights to SMEs. The author concludes that SMEs should devote greater attention to intellectual property rights but does not address the dynamic nature of small firm innovation that makes patent rights an inherently ineffective tool of protection for

traditional SMEs, neither is the effect of patent protection on total welfare taken into account. Despite the important economic literature analyzing the role of patents in innovation and growth, the application of broad insights to the SME context requires nuanced analysis integrating macroeconomic concerns with firm-specific criteria before robust conclusions can be established.

¹⁴³ At a minimum, the legislation created a prior user right. See American Inventors Protection Act, Pub. L. No. 106-113 (1999) (codified in 35 U.S.C.).

¹⁴⁴ Okediji, *supra* note 18 (emphasizing the need for clear property rules on the Internet to prevent a chilling effect on small businesses and to reduce entry costs associated with uncertainty). In addition to intellectual property rights, common law doctrines have also been used to limit competition on the Internet. See e.g., Ticketmaster Corp v. Tickets.com, Inc., 54 U.S.P.Q. 2d 1344 (C.D. Cal 2000); eBay, Inc. v. Bidder's Edge, Inc. 100 F. Supp. 2d 1058 (N.D. Cal 2000). See generally, Maureen A. O'Rourke, *Property Rights and Competition on the Internet: In Search of an Appropriate Analogy*, 16 BERKELEY TECH. L.J. 561 (2001); Maureen A. O'Rourke, *Shaping Competition on the Internet: Who Owns Product and Pricing Information?* 53 VAND. L. REV. 1965 (2000).

¹⁴⁵ See *The Knowledge Monopolies*, THE ECONOMIST, p. 76, April 8, 2000.

¹⁴⁷ Roberta Morris, *Some Data About Patents in Class 705 (Alone and Compared to Other Classes)*, *Intellectual Property Today* 51 (May 2001).

¹⁴⁸ *Id.*

¹⁴⁹ See Article 52 (1) of the European Patent Convention; 35 U.S.C. § 101. See also *Marrakesh Agreement Establishing the World Trade Organization*, Annex 1C: Agreement on Trade-Related Aspects of Intellectual Property Rights, 15 April 1994, 33 I.L.M. 81 (1994) [hereinafter TRIPS Agreement], Art. 27(1).

¹⁵⁰ EPC, Art. 57.

¹⁵¹ EPC, Art. 52(2).

¹⁵² EPC, Art. 52(3).

¹⁵³ See EPC, Rule 27 and Rule 29.

¹⁵⁴ See *Patentability of Methods of Doing Business*, EPO Press Release (2000), available at http://www.european-patent-office.org/news/pressrel/2000_08_18_e.htm.

¹⁵⁵ According to the EPO, "although methods for doing business, programs for computers, etc., are as such explicitly excluded from patentability, a product or a method which is of a technical character may be patentable, even if the claimed subject-matter defines or at least involves a business method, a computer program, etc. . . . methods for doing business and computer programs are not always excluded from patentability" See *Patentability of Methods of Doing Business*, EPO Press Release (2000), available at http://www.european-patent-office.org/news/pressrel/2000_08_18_e.htm.

¹⁵⁶ EPO Board of Appeal Decision T 93/0605.

¹⁵⁷ Decision T 92/0769 Sohei.

¹⁵⁸ *Id.* See also, Decision EPO T 1173/97.

¹⁵⁹ Keith Beresford, Patents, Copyrights, Trademarks, and Literary Property Course Handbook Series, *Business Method Patents: How to Protect Your Clients' Interests* 62 (2002) (noting relevance of national court decisions in EU patent law); Karen A. Spindler, Comment, *Current Patent Protection Granted for Genetically Modified Organisms under the European Patent Convention and the Scandal of EP 0695351*, 18 SANTA CLARA COMPUTER & HIGH TECH. L.J. 95, 114-15 (2001) (noting continued power of national courts in the EU to interpret EU patent rules).

¹⁶⁰ Class 705 (Modern Business Data Processing). This class definition states: "This is the generic class for apparatus and corresponding methods for performing data processing operations, in which there is a significant change in the data or for performing calculation operations wherein the apparatus or method is uniquely designed for or utilized in the practice, administration, or management of an enterprise, or in the processing of financial data. This class also provides for apparatus and corresponding methods for performing data processing or calculating operations in which a charge for goods or services is determined." See U.S. Patent Classification System - Classification Definitions as of June 30, 2000, available at <http://www.uspto.gov/web/offices/ac/ido/oeip/taf/def/705.htm>. According to the USPTO, there are four major groups of applications in this class. They are those that are related to business operations of : (1) Determining Who Your Customers Are, and The Products/Services They Need/Want (Operations Research - Market Analysis); (2) Informing Customers You Exist, Showing Them Your Products & Services, and Getting Them to Purchase (Advertising Management; Catalog Systems; Incentive

Programs; Redemption of Coupons); (3) Exchanging Money and Credit Before, During, and After the Business Transaction (Credit and Loan Processing; Point of Sale Systems; Billing; Funds Transfer; Banking; Clearinghouses; Tax Processing; Investment Planning); (4) Tracking Resources, Money, And Products (Human Resource Management; Scheduling; Accounting; Inventory Monitoring). See USPTO White Paper, *supra*.

¹⁶¹ See Proposal of 20 February 2002 for a Directive of the European Parliament and of the Council on the patentability of computer-implemented inventions/*COM/2002/0092 final - Official Journal C151 E, 25/06/.2002 p. 0129-0131.

¹⁶² India has an explicit rule prohibiting business method patents. This is an important legislative step for a country whose software industry is a significant player in world markets. See the 2002 Amendment to the Indian Patent Act (from <http://www.laws4india.com/intellectual/patent/patentg.pdf>) <http://www.laws4india.com/intellectual/int-patAct.asp>. The amendment is to section 3 of the 1970 Act.

¹⁶³ See generally, Brian P. Biddinger, *Limiting the Business Method Patent: A Comparison and Proposed Alignment of European, Japanese and United States Patent Law*, 69 *FORDHAM LAW REVIEW* 2523 (2000-2001).

¹⁶⁴ See Marrakesh Agreement Establishing the World Trade Organization, Annex 1C: Agreement on Trade-Related Aspects of Intellectual Property Rights, 15 April 1994, 33 I.L.M. 81 (1994) [hereinafter, TRIPS Agreement]. Article 27(1) provides: Subject to the provisions of paragraphs 2 and 3, patents shall be available for any inventions, whether products or processes, in all fields of technology, provided that they are new, involve an inventive step and are capable of industrial application.⁵ Subject to paragraph 4 of Article 65, paragraph 8 of Article 70 and paragraph 3 of this Article, patents shall be available and patent rights enjoyable without discrimination as to the place of invention, the field of technology and whether products are imported or locally produced. See also John R. Thomas, *The Patenting of the Liberal Professions*, 40 *BOSTON C. L. REV.* 1139 (1999).

¹⁶⁵ Interestingly, eBay which owns business method patents for its online trading business was recently found liable for patent infringement for the "Buy it Now" function offered on its Internet auction site. The "Buy it Now" option offers fixed-price options on eBay's main auction site. See *Mercexchange v. eBay*, No. 2:01cv736, E.D. Va. (2003). Although the court did not issue an injunction against eBay, it ordered the company to pay \$29.5 million in damages for infringement of the plaintiff's business method patent.

¹⁶⁶ In 2000 and 2001, the EPO reported record filings with the largest applications related to electronic communications, medical technology, electrical components and data processing. In 2000, data processing applications grew by 28%. See http://www.european-patent-office.org/news/pressrel/2002_06_20_e.htm; http://www.european-patent-office.org/news/pressrel/2001_07_20_e.htm.

¹⁶⁷ See *Feist Publications, Inc. v. Rural Telephone Service Co.*, 499 U.S. 340 (1991). See generally, Daniel Gervais, *Feist Goes Global: A Comparative Analysis of the Notion of Originality in Copyright Law*, *J. OF THE COPYRIGHT. SOCIETY OF THE USA*, 949-981 (2002).

¹⁶⁸ Directive 96/9/EC on the legal protection of databases, March 11, 1996.

¹⁶⁹ See *id.*, Article 7.

¹⁷⁰ For a detailed discussion of negotiations for database protection in the U.S., see J. H. Reichman and Paul F. Uhlir, *Database Protection at the Crossroads: Recent Developments and Their Impact on Science and Technology*, 14 *Berkeley Tech. L.J.* 793 (1999).

¹⁷¹ Reichman & Uhlir, *Id.* See also, *European Union Database Directive Sets Dangerous Precedent for Librarians Worldwide*, Association of Research Libraries, at <http://www.arl.org/info/frn/copy/iff1.html>; William Gardner and Joseph Rosenbaum, *Database Protection and Access to Information*, *Science Magazine*, available at <http://www.sciencemag.org/cgi/content/full/281/5378/786>. See generally, Anne Linn, *History of Database Protection: Legal Issues of Concern to the Scientific Community*, National Research Council, USA March 2000, available at http://www.codata.org/codata/data_access/linn.html.

¹⁷² On October 8, 2003, several representatives to Congress introduced H.R. 3261, the Database and Collections of Information Misappropriation Act. H.R. 3261 is available from Thomas: Legislative Information on the Internet, <http://thomas.loc.gov>.

¹⁷³ In September 1997, WIPO convened an Information Meeting on Database Protection to discuss possible actions on a treaty to protect intellectual property rights in databases. No action was taken at this meeting and no treaty currently exists for international database protection. Some commissioned WIPO papers make the case that an international treaty on the protection of unoriginal databases provides advantages to all countries. See Yale Braunstein, *Economic Impact of Database Protection in Developing Countries and Countries in Transition*, Study prepared for the WIPO Standing Committee on Copyright and Related Rights, SCCR/7/2 April 4, 2002; Phiroz Vandrevala, *A Study on Impact of Protection of Unoriginal Databases on Developing Countries: Indian Experience*, Study prepared for the WIPO Standing Committee on Copyright and Related Rights, SCCR/7/5, April 4, 2002.

Resistance to a proprietary model of any proposed protection for databases remains strong in the academic and scientific community.

¹⁷⁴ In 2001, WIPO commissioned five papers to study the economic impact of nonoriginal databases in developing countries and countries in transition. The papers are available at www.wipo.org.

¹⁷⁵ See e.g., *National Basketball Association v. Motorola, Inc.*, 105 F.3d 841 (2d Cir. 1997).

²⁰⁰ *Id.*

²⁰¹ See OECD Policy Brief, *Opening up Trade in Services: Opportunities and Gains for Developing Countries*, August 2003 (identifying gains in developing countries in information technology related areas such as audiovisual services, software development, data processing, network operations and cultural services). *Electronic Commerce and Music Business Development in Jamaica: A Portal to the New Economy?*, UNCTAD/ITE/TEB/8 [hereinafter, *Music Business Development in Jamaica*].

²⁰² *Music Business Development in Jamaica*, *id.* The potential effect of the Internet on education has been widely discussed as a global phenomenon. Other than infrastructural barriers, developed and developing countries share similar interests in how the Internet can be used to more effectively deliver educational opportunities to the public. The complicated structure of copyright in educational content also poses similar problems for both developed and developing countries. See generally, Jon. M. Garon, *The Electronic Jungle: The Application of Intellectual Property Law to Distance Education*, 4 *VAND. J. ENT. L. & PRAC.* 146 (2002) (discussing the copyright scheme in educational content and use).

²⁰³ Economic Potential of Music for LDFCs, Africa News Service, May 21, 2001 (noting that music, as well as other cultural goods can provide new production and trading opportunities for developing countries, but noting barriers caused by concentration of large multinational firms who control the global industry); Birgitte Andersen, Zeljka Kozul-Wright, Richard Kozul-Wright, *Copyrights, Competition and Development: The Case of the Music Industry*, UNCTAD/OSG/DP/145 (2000), at p. 10 (noting the "urgent need" to strengthen export opportunities for artists from developing countries). See also, Robert Burnett, *The Global Jukebox: The International Music Industry*, 3-4 (1995) (noting that "the music industry has also at least partially provided the foundation for many of today's transnational, diversified communication conglomerates. Thus, despite the continuous introduction of new forms of entertainment and communications technology, the music industry remains an important component of the expanding information and entertainment sector. It is especially important to remember that popular music has developed as a commodity which is produced, distributed and consumed under market conditions that inevitably influence the types of phonograms made, who make them, and how they are distributed to the public").

²⁰⁴ Frank J. Penna, Coenraad J. Visser, *Cultural Industries and Intellectual Property Rights*, in *Development, Trade and the WTO: A Handbook*, 390 (2002) (citing examples). See also, Brigitte Andersen, Zeljka Kozul-Wright, Richard Kozul-Wright, *id.* note 192.

²⁰⁵ Lydia Pallas Loren, *Untangling the Web of Music Copyrights*, 53 *CASE W. RES. L. REV.* 673, 673 (2003) (stating that the music industry is "in crisis"); R. Anthony Reese, *Copyright and Internet Music Transmissions: Existing Law, Major Controversies, Possible Solutions*, 55 *U. MIAMI L. REV.* 237, 237 (2001) (noting changes in the music industry caused by the Internet).

²⁰⁶ In September 2003, the music industry filed lawsuits against 261 alleged online file swappers. Some of those sued included children. This offensive strategy is designed to curb unauthorized reproduction and distribution of musical works. However, some reports indicate that sources of the unauthorized distribution protected works are within the industry. See John Schwartz, *Is Legal Action Against File Swappers Good Business?* *THE NEW YORK TIMES*, C1, September 15, 2003.

²⁰⁷ Eviatar, *supra* note 113, at 4-5 (briefly discussing traditional contracts between music companies and artists, and some expected changes to this model). This statement should be qualified by the fact that there is rarely a single creator of a musical work. Indeed, the complexity of music copyrights and the multiple artists involved in producing a musical work creates the need for an administrative tool to coordinate these interests and efficiently manage the music enterprise. This complexity is at least partly responsible for the disparate power of producers who assume the responsibility for coordinating, promoting and funding the various artists and necessary equipment.

²⁰⁸ Burnett, *supra* note 193, at 1 (1995).

²⁰⁹ *Id.* at 3 (citing IFPI). As of 2002, this amount was estimated at US\$32 billion, reflecting a decline both over time as well as in current dollar terms. The music industry associates the decline with music piracy. See Recording Industry Association of America (RIAA), *Some Facts About Music Piracy* (2003), [http://www.riaa.com/news/ newsletter/ 062503_c.asp](http://www.riaa.com/news/newsletter/062503_c.asp).

²¹⁰ <http://www.ifpi.org/site-content/antipiracy/piracy2003-the-key-facts.html>.

²¹¹ For a detailed analysis of the multiple layers of copyright protection in music see, Loren, *supra* note 205.

²¹² To further complicate matters, the terminology for various copyrightable expressions in music may differ from country to country. For example, what constitutes a sound recording is different in the United States and the United Kingdom.

²¹³ See Loren, *supra* note 205 at 680-698 (discussing various licenses in the United States for musical works).

²¹⁴ Burnett, *supra* note 203, at 2 (citing IFPI).

²¹⁵ *Music Business Development in Jamaica*, *supra* note 201 (discussing a variety of institutional factors constraining the potential of the domestic music industry in Jamaica. Despite a degree of sophistication and success, the Jamaican music industry still faces the challenge of global penetration as other developing countries).

²¹⁶ Berne Convention for the Protection of Literary and Artistic Works, Sept. 9, 1886, as last revised July 24, 1971, amended Oct. 2, 1979, S. Treaty Doc. No. 99-27, 828 U.N.T.S. 221.

²¹⁷ *Id.*, art. 1.

²¹⁸ Art. 9 of the TRIPS Agreement incorporates art. 1-21 (excluding art. 6bis) of the Berne Convention.

²¹⁹ Berne Convention, *supra* note 216, art. 2.

²²⁰ *Id.*, art. 2(3).

²²¹ For example, France, Germany and Italy.

²²² There is little substantive distinction between countries who protect these works under a “neighboring rights” regime and those who do so under a copyright system. The main difference was one of international significance: if these works are protected as “literary and artistic works” in the country’s domestic legislation, copyright protection must extend on the terms required by the Berne Convention. If a country did not define these works as “literary and artistic works” then the country was not obliged to extend national treatment provisions nor the minimum requirements to those works originating from a foreign country. Several international agreements provided protection to neighboring rights distinct from copyright, although the seminal treaty established a subordinate role for neighboring rights in relation to copyright. Article 1 of the Rome Convention provides that protection under the Convention “shall in no way affect the protection in copyright in literary and artistic works. Consequently, no provision of this Convention may be interpreted as prejudicing such protection.” See International Convention for the Protection of Performers, Producers of Phonograms and Broadcasting Organizations (Rome Convention) 1961. Subsequent agreements retained this structural relationship to the Berne Convention. See art. 7 (1), Convention for the Protection of Producers of Phonograms Against Unauthorized Duplication of Their Phonograms (Geneva Phonograms Convention) 1971; art. 1(2) of the WIPO Performances and Phonograms Treaty (1996); and art. 15 of the TRIPS Agreement. Today, the TRIPS Agreement has, for all intents and purposes, negated the distinction by requiring protection for performers, producers of phonograms (sound recordings) and broadcasting organizations. See TRIPS art. 14. Should any question arise, art. 2(2) of TRIPS provides that nothing “shall derogate from existing obligations that members have to each other under the ... Berne Convention, Rome Convention...” Thus, even the TRIPS Agreement reinforces the structure first adopted by the Rome Convention, privileging copyright interests above any other rights. See also, Convention Relating to the Distribution of Programme-Carrying Signals Transmitted by Satellite (Brussels Satellite Convention) (1974). For an overview of the history of the neighboring rights agreements and their relationship to the Berne Convention, see Sam Ricketson, *The Berne Convention for the Protection of Literary and Artistic Works: 1886-1986* (1987). See also, Paul Goldstein, *International Copyright: Principles, Law, and Practice*, 36-47 (2001) (discussing neighboring rights treaties).

²²³ Berne Convention, *supra* note 216, art. 9 (1).

²²⁴ Berne Convention, art. 9(2); TRIPS Agreement, art. 13. For analyses and discussion of the differences between the TRIPS and Berne framework for assessing national limitations or exceptions to copyright, see Jane C. Ginsburg, *Toward Supranational Copyright Law? The WTO Panel Decision and the “Three-Step Test” for Copyright Exceptions*, in *REVUE INTERNATIONALE DU DROIT D’AUTEUR* 72 (2001). For an early analysis of how a TRIPS dispute panel might interpret the Berne Convention provision, see Neil Netanel, *The Next Round: The Impact of the WIPO Copyright Treaty on TRIPS Dispute Settlement*, 37 *VA. J. INT’L L.* 441 (1997). For analysis of the role of copyright limitations in promoting public welfare and advocating for an international limitation of fair use, see Ruth Okediji, *Toward an International*

Fair Use Standard, 39 COLUMBIA J. TRANSN'L L. 75 (2000) [hereinafter Okediji, *Fair Use Standard*] (analyzing the relationship between TRIPS Article 13 and the U.S. fair use doctrine).

²²⁵ See WTO Dispute Panel Report, United States-Section 110(5) of the U.S. Copyright Act, June 15, 2000, WTO Doc. WT/DS160/R (2000).

²²⁶ There is a question whether countries that protect musical works under neighboring rights will be subject to the same analysis with respect to works that are defined differently under copyright systems since arguably, such works may not be within the purview of the TRIPS incorporation of the Berne Convention. See *supra* note 222.

²²⁷ *Id.* art. 9(3).

²²⁸ *Id.*

²²⁹ *Id.* art.13. It isn't clear if such discretion must conform to the requirements of TRIPS Article 13. This author believes that the answer to this question is "no" under general principles of international law and under a careful reading of the Berne Convention.

²³⁰ This is further subject to Art. 14(4) which allows member countries to substitute this requirement with a system of equitable remuneration for the rental of phonograms so long as such commercial rental does not result in "the material impairment of the exclusive rights of reproduction of right holders." See *id.* This compromise provision allowed Japan to keep its system of equitable remuneration. See Daniel Gervais, *The TRIPS Agreement: Drafting History and Analysis*, 99-100 (1998).

²³¹ In the United States, the reproduction right is limited to reproduction of the actual sounds.

²³² In some countries, the term "phonograms" is defined broadly enough to include sound recordings. In general, reconciling the differences in treatment between phonograms and sound recordings is helped by the WPPT which defines a "phonogram" in a way that could also cover sound recordings. See art. 2(b).

²³³ The language used in TRIPS art. 14 (1) is "performers shall have the possibility of preventing" the acts described. Art. 14(1) is substantially the same as Art. 7.1(b) and 7.1(c) of the Rome Convention, which also uses the same phrase. This language means that countries have some discretion in how to implement this obligation. Countries may use a system of imposing levies, fines or copyright-type schemes. A leading commentator has stated that a compulsory license scheme under the Rome Convention was not anticipated as a permissible means of implementing the obligation. See Claude Masouye, *Guide to the Rome Convention and to the Phonograms Convention* 34, (1981).

²³⁴ See <http://www.ifpi.org>.

²³⁵ See, e.g., Dawn R. Maynor, Note, *Just Let the Music Play: How Classic Bootlegging Can Buoy the Drowning Music Industry*, 10 J. INTELL. PROP. L. 173, 200 (2002) (noting "explosion" of Latin music).

²³⁶ *But see*, *Collective Management in the Caribbean: Achieving Results*, WIPO MAGAZINE, September/October (2003) (discussing recent developments in the Caribbean and showing a growth in membership of Caribbean societies).

²³⁷ Loren, *supra* note 205 (discussing the American setting); BURNETT, *supra* note 203 (discussing generally the global industry); Jonathan Potter, *Confronting the Digital Era: Thoughts on the Music Sector* in Brie-IGCC, *Tracking a Transformation: E-Commerce and the Terms of Competition in Industries* (BROOKINGS, 2001) at 129-130,133 (discussing the parties in the music industry and the possibility of global direct licensing through the Internet as a different model to overcome the difficulties associated with collective licensing organizations). See also, Roger Wallis and Krister Malm, *Big Sounds from Small Peoples: The Music Industry in Small Countries* 163-215 (1984) (discussing in detail with examples, problems with revenue collection and distribution and collecting/licensing organizations).

²³⁸ Potter, *Id.*

²³⁹ Richard D. Rose, *Connecting the Dots: Navigating the Laws and Licensing Requirements of the Internet Music Revolution*, 42 IDEA 313, 316-17 (2002) (detailing some of the recording industry's technological approaches to protecting its products from unauthorized copying).

²⁴⁰ Goldstein and O'Conner, *supra* note 197 at 11 (noting that B2B e-commerce is "reshaping the competitive dynamics in traditional producer-driven and buyer-driven value chains..."). Although the authors refer specifically to the automobile and coffee markets, this observation is highly applicable to cultural industries, particularly music.

²⁴¹ In publishing, for example, new models of publishing that empower users and authors are being explored. See Diane L. Zimmerman, *Authorship without Ownership: Reconsidering Incentives in a Digital Age*, DEPAUL L. REV. (2003) (describing various models).

²⁴² See generally <http://www.itu.int/wsis/>.

²⁴³ See <http://ocw.mit.edu/index.html>.

²⁴⁴ *Id.*

- ²⁴⁵ For a recent similar project, see Net Lifeline for African Doctors, University of Toronto Project Provides Online Medical Papers for African Doctors, <http://news.bbc.co.uk/2/hi/technology/3211844.stm>.
- ²⁴⁶ The OCW project permits translation for non-commercial educational purposes. It is unclear given current judicial precedent in the United States whether an educational institution that downloads OCW material but charges students for the cost of downloads will be violating the OCW stipulation. See e.g., *Princeton University Press v. Michigan Document Services, Inc.* 99 F.3d 1381 (6th Cir. 1996).
- ²⁴⁷ See Ricketson, *supra* note 222 at 663.
- ²⁴⁸ See Ruth L. Okediji, *Sustainable Access to Digital Works* (forthcoming, 2004) (exploring the legal viability of the Berne Appendix in the context of the WIPO Internet Treaties).
- ²⁴⁹ See Art. 9 (1).
- ²⁵⁰ The United States has its own access regime for educational instruction. See "Technology, Education, and Copyright Harmonization Act of 2002" or "TEACH Act." (2002). See generally, Laura Gasaway, *Balancing Copyright Concerns: The TEACH Act of 2001*, EDUCAUSE REV. 82 (2001).
- ²⁵¹ Although international activity concerning database protection has been dormant for several years, the recent proposed bill in circulation in the U.S. House of Representatives indicates that this silent stage will surely be short lived. It is fairly predictable that once the U.S. passes a database bill, regardless of its iteration, movement toward an international treaty will follow inevitably. On the proposed U.S. bill in circulation, see "Databases—the Next Copyright Battle?" Reuters September 5, 2003.
- ²⁵² See Georg von Krogh, *Open- Source Software Development: An Overview of New Research on Innovator's Incentives and the Innovation Process*, 44 MIT SLOAN MANAGEMENT REV. 14, 14 (2003) (describing open-source software development as "an important economic and cultural phenomenon").
- ²⁵³ Josh Lerner and Jean Tirole, *Some Simple Economics of Open Source*, 197, 200-201, THE JOURNAL OF INDUSTRIAL ECONOMICS, 197 (June 2002).
- ²⁵⁴ Lerner and Tirole, *id.* at 197.
- ²⁵⁵ *Id.* at 198. See also, Alfonso Fuggetta, *Open Source Software—An Evaluation*, 66 THE JOURNAL OF SYSTEMS AND SOFTWARE, 77, 77-78 (2003).
- ²⁵⁶ *Id.* See also, John Landry, *Profiting from Open Source*, 78 HARVARD BUSINESS REVIEW, 22 Sep/Oct. 2000 (interview about Hewlett Packard's decision to use open-source as its model for one of its software products).
- ²⁵⁷ See Tim O'Reilly, *Lessons from Open-Source Software Development*, COMMUNICATIONS OF THE ACM, 33 April 1999; David Bretthauer, *Open Source Software: A History, Information Technology and Libraries*, 3 March 2002.
- ²⁵⁸ The GNU GPL is available at <http://www.fsf.org/copyleft/gpl.html>.
- ²⁵⁹ See generally, Shahid H. Bokhari and Rafeequr Rehman, *Linux and the Developing World*, IEEE Software January/February 1999.
- ²⁶⁰ Shahid H. Bokhari and Rafeequr Rehman, *id.*, at 59-61 (describing teaching with Linux in Pakistan).
- ²⁶¹ See e.g., UNCTAD E-Commerce and Development Report (2002). In July 2003, WIPO was asked to convene a meeting to discuss the relevance of open-source as a model for development and economic growth. The proposal was ultimately rejected at the objection of the United States Patent and Trademark Office. See generally Jonathan Krim, *The Quiet War Over Open-Source*, THE WASHINGTON POST, Aug. 21, 2003.
- ²⁶² See e.g., Free and Open Source Software Foundation for Africa Launched, Africa News Service, March 7, 2003.
- ²⁶³ See Darryl K. Taft, *Open-Source Movement Gains Ground on Microsoft*, EWEEK, March 24, 2003 (discussing a proposal in Texas that would enable the state to consider open-source technology in its software procurements). The state of Oregon was considering a similar proposal. See also *Massachusetts Goes Open Source*, News Factor Network, October 20, 2003.
- ²⁶⁴ See *Caldera v. IBM*, complaint available at <http://www.sco.com/scosource/complaint3.06.03.html>. The lawsuit has implications for all Linux users and is being watched carefully by the entire open source community. See generally, Eric Raymond, OSI Position Paper on the SCO-vs.-IBM Complaint, available at <http://www.opensource.org/sco-vs-ibm.html>.

APPENDIX A: The Top 20 Countries with the Highest Internet Penetration Rate

	Country or Region	Penetration (% Population)	Population (Est. 2003)	Users Latest Data	Source of Latest Data
1	Sweden	67.9 %	8,872,600	6,025,927	NielsenNR - May/03
2	Hong Kong	67.0 %	6,827,000	4,571,536	NielsenNR - May/03
3	Netherlands	63.7 %	16,258,300	10,351,064	NielsenNR - May/03
4	Denmark	62.7 %	5,387,300	3,375,850	NielsenNR - July/02
5	United States	60.5 %	291,639,900	176,418,380	NielsenNR - May/03
6	Iceland	59.5 %	294,300	175,000	ITU - Dec/2002
7	Switzerland	57.8 %	7,376,000	4,264,828	NielsenNR - May/03
8	South Korea	56.1 %	46,852,300	26,270,000	ITU - Dec/2002
9	Singapore	54.6 %	4,225,000	2,308,296	NielsenNR - May/02
10	New Zealand	54.5 %	3,785,600	2,063,831	NielsenNR - Aug/02
11	Australia	54.0 %	19,978,100	10,792,601	NielsenNR - May/03
12	Germany	53.3 %	81,904,100	43,664,594	NielsenNR - May/03
13	Canada	53.1 %	31,720,400	16,841,811	NielsenNR - Mar/02
14	Finland	50.8 %	5,215,100	2,650,000	ITU - Dec/2002
15	Norway	50.5 %	4,551,100	2,300,000	ITU - Dec/2002
16	Taiwan	49.1 %	23,614,2 00	11,602,523	NielsenNR - July/01
17	United Kingdom	49.1 %	59,040,300	28,995,206	NielsenNR - May/03
18	Bermuda	46.5 %	64,500	30,000	ITU - Dec/2001
19	Japan	45.0 %	127,708,000	57,520,708	NielsenNR - May/03
20	Estonia	44.2 %	1,268,300	560,000	ITU - Dec/2002
TOP 20 Countries		55.0 %	746,582,400	410,782,155	IWS - Jul/2003
